## General Description

The TPV2333S8 of CMOS operational amplifiers use a proprietary auto-calibration technique to simultaneously provide very low offset voltage ( $\pm 10\text{uV}$ , maximum) and near-zero drift over time and temperature. These miniature, high-precision, low quiescent current (17 $\mu$ A) amplifiers offer high impedance inputs that have a common-mode range 100 mV beyond the rails, and rail-to-rail output that swings within 50 mV of the rails. Single or dual supplies as low as 1.8 V ( $\pm 0.9$  V) and up to 5.5 V (+2.75 V) can be used. These devices are optimized for low voltage, single-supply operation.

### Notes:

- 1: All devices are 100% production tested at  $T_A = +25^\circ\text{C}$ ; range is guaranteed by design, not production tested.
- 2: Parameter is guaranteed by design.
- 3: Capacitive load drive means that above a given maximum value, the output waveform will oscillate under the step response.
