
SLUS272F – FEBRUARY 2000 – REVISED AUGUST 2006

LOW-POWER, DUAL-OUTPUT, CURRENT-MODE PWM CONTROLLER

FEATURES

- **BiCMOS Version of UC3846 Family**
- **1.4-mA Maximum Operating Current**
- **100-μA Maximum Startup Current**
- **±0.5-A Peak Output Current**
- **125-ns Circuit Delay**
- **Easier Parallelability**
- **Improved Benefits of Current Mode Control**

DESCRIPTION

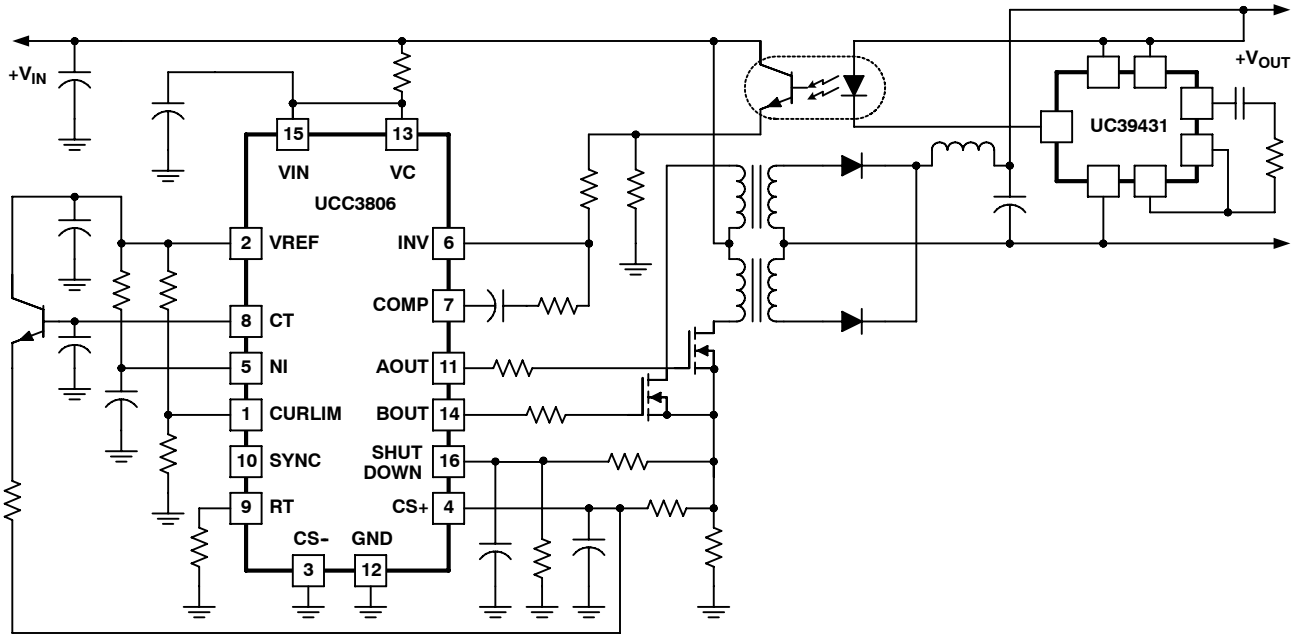
The UCC3806 family of BiCMOS PWM controllers offers exceptionally improved performance with a familiar architecture. With the same block diagram and pinout of the popular UC3846 series, the UCC3806 line features increased switching frequency capability while greatly reducing the bias current used within the device. With a typical startup current of 50 μA and a well defined voltage threshold for turn-on, these devices are favored for applications ranging from off-line power supplies to battery operated portable equipment. Dual high-current, MOSFET driving outputs and a fast current sense loop further enhance device versatility.

All the benefits of current mode control including simpler loop closing, voltage feed-forward, parallelability with current sharing, pulse-by-pulse current limiting, and push/pull symmetry correction are readily achievable with the UCC3806 series.

These devices are available in multiple package options for both through-hole and surface mount applications; and in commercial, industrial, and military temperature ranges.

The UCC1806 is specified for operation from –55°C to 125°C, the UCC2806 is specified for operation from –40°C to 85°C, and the UCC3806 is specified for operation from 0°C to 70°C.

SIMPLIFIED APPLICATION DIAGRAM



These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted(1)

		UCx806	UNIT
Supply voltage, V_{IN}	VIN, low impedance	15	V
Supply current, I_{IN}	VIN, high impedance	25	mA
Output supply voltage	VC	18	V
Output current	Continuous source or sink	± 200	mA
	Gate drive	± 500	
	SYNC	± 30	
	COMP	± 10 to –(self-limiting)	
Analog input voltage range	CS–, CS+, NI, INV, SHUTDOWN	–0.3 to (V_{IN} + 0.3)	V
Storage temperature, T_{stg}		–65 to 150	°C
Operating temperature, T_J		–55 to 150	°C
Lead temperature, T_{sol}, 1,6 mm (1/16 inch) from case for 10 seconds		300	°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltages are with respect to GND. Currents are positive into and negative out of, the specified terminal.

RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
Input voltage, V_{IN}		8.0		14.5	V
Operating junction temperature, T_J	UCC1806	–55		125	°C
	UCC2806	–40		85	
	UCC3806	0		70

I	Operating supply current				1.0	1.4	mA
	V_{IN} shunt voltage		I_{VIN} = 10 mA	15.0		17.5	

(1) Line range = 10 V to 15 V, load range = 0.2 mA to 5 mA
(2) Ensured by design. Not production tested.
(3) Parameters measured at trip point of latch with V_{NI} = VREF , V_{INV} = 0V.
(4) Amplifier gain defined as: G = delta change at COMP /delta change forced at CS+ delta voltage at CS+ = 0 to 1V
(5) Current-sense amplifier output is slew rate limited to provide noise immunity.

THERMAL RESISTANCE TABLE

PACKAGE DESIGNATOR	PACKAGE TYPE	θ_{JC} (°C/W)	θ_{JA} (°C/W)
D	SOIC–16	35	50 to 120(1)
DW	SOICW–16	27	50 to 100(1)
J	CDIP–16	28	80 to 120
L	CLCC–20	20	70 to 80
M	SSOP–16	38	144 to 172(2)
N	PDIP–16	45	90(1)
PW	TSSOP–16	15	123 to 147(2)
Q	PLCC–20	34	43 to 75(1)

(1) Specified θ_{JA} (junction to ambient) is for devices mounted to 5 in^2 FR4 PC board with one ounce copper where noted. When resistance range is given, lower values are for 5 in^2 aluminum PC board. Test PWB was 0.062 in thick and typically used 0.635 mm trace widths for power packages and 1.3 mm trace widths for non-power packages with a 100x100 mil probe land area at the end of each trace.
(2) Modeled data. If value range given for θ_{JA}, the lower value is for 3x3 inch1 oz internal copper ground plane, and the higher value is for 1x1 inch ground plane. All model data assumes only one trace for each non-fused lead.

TERMINAL FUNCTIONS

TERMINAL NAME	TERMINAL PACKAGES D/DW/J/M /N/PW	TERMINAL PACKAGES L,Q	I/O	DESCRIPTION
AOUT	11	14	O	High-current gate drive for the external MOSFETs
BOUT	14	18		
COMP	7	9	O	Output of the error amplifier
CS–	3	4	I	Inverting input of the 3×, differential current sense amplifier
CS+	4	5	I	Non-inverting input of the 3×, differential current sense amplifier
CT	8	10	I	Oscillator timing capacitor connection point
CURLIM	1	2	I	Programs the primary current limit threshold that determins latching or retry after an overcurrent situation
GND	12	15	–	Reference ground and power ground for all functions of this device
INV	6	8	I	Inverting input of the error amplifier.
NI	5	7	I	Non-nverting input of the error amplifier.
RT	9	12	I	Connection point for the oscillator timing resistor
SHUTDOWN	16	20	I	Provided for enhanced protection. When SHUTDOWN is driven above 1 V, AOUT and BOUT are forced low.
SYNC	10	13	I/O	Allows providing external synchronization with TTL compatible thresholds.
VC	13	17	I	Input supply connection for the FET drive outputs.
VIN	15	19	I	Input supply connection for this device.
VREF	2	3	O	Reference output.

DETAILED PIN DESCRIPTIONS

AOUT and BOUT: AOUT and BOUT provide alternating high current gate drive for the external MOSFETs. Duty cycle can be varied from 0% to 50% where minimum dead time is a function of CT. Both outputs use MOS transistor switches with inherent anti-parallel body diodes to clamp voltage swings to the supply rails, allowing operation without the use of clamp diodes.

COMP: COMP is the output of the error amplifier and the input of the PWM comparator. The error amplifier is a low output impedance, 2-MHz operational amplifier which allows sinking or sourcing of current at the COMP pin. The error amplifier is internally current limited, so that zero duty cycle can be commanded by externally forcing COMP to GND.

CS–: CS– is the inverting input of the 3× differential current sense amplifier.

CS+: CS+ is the non-inverting input of the 3× differential current sense amplifier.

CT: CT is the oscillator timing capacitor connection point, which is charged by the current set by RT. CT is discharged to GND through a 2.5-mA current sink. This causes a linear discharge of CT to 0 V which then initiates the next switching cycle. Dead time occurs during the discharge of CT, forcing AOUT and BOUT low. Switching frequency (f_S) and dead time (t_D) are approximated by:

$$f_S = \frac{1}{1.96 \times R_T \times C_T + t_D} \quad \text{and} \quad t_D = 956 \times C_T \tag{1}$$

DETAILED PIN DESCRIPTIONS (continued)

CURLIM: CURLIM programs the primary current limit threshold and determines whether the device latches off or retries after an overcurrent condition. When a shutdown signal is generated, a 200-μA current source to ground pulls down on CURLIM. If the voltage on the pin remains above 350 mV the device remains latched and the power must be cycled to restart. If the voltage on the pin falls below 350 mV, the device attempts a restart. The voltage threshold is typically set by a resistor divider from V_{REF} to ground. To calculate the current limit adjust voltage threshold the following equations can be used.

Current limit adjust latching mode voltage is calculated in equation (2)

$$V = \frac{V_{REF} - (R1 \times 300\ \mu A)}{1 + \left(\frac{R1}{R2}\right)} > 350\ mV \quad (2)$$

Current limit adjust non-latching mode voltage is calculated in equation (3)

$$V = \frac{V_{REF} - (R1 \times 80\ \mu A)}{1 + \left(\frac{R1}{R2}\right)} < 350\ mV \quad (3)$$

where

- R1 is the resistance from the VREF to CURLIM
- R2 is the resistance from CURLIM to GND

GND: GND is the reference ground and power ground for all functions of this part. Bypass and timing capacitors should be connected as close as possible to GND.

RT: RT is the connection point for the oscillator timing resistor. It has a low impedance input and is nominally at 1.25 V. The current through RT is mirrored to the timing capacitor pin, CT. This causes a linear charging of CT from 0 V to 2.35 V. Note that the current mirror is limited to a maximum of 100 μA so R_T must be greater than 12.5 kΩ.

SYNC: SYNC is a bi-directional pin, allowing or providing external synchronization with TTL compatible thresholds. In a typical application RT is connected through a timing resistor to GND which allows the internal oscillator to free run. In this mode SYNC outputs a TTL compatible pulse during the oscillator dead time (when CT is being discharged). If RT is forced above 4.4 V, SYNC acts as an input with TTL compatible thresholds and the internal oscillator is disabled. When SYNC is high, greater than 2 V the outputs are held active low. When SYNC returns low, the outputs may be high until the on–time is terminated by the normal peak current signal, a fault seen at SHUTDOWN or the next high assertion of SYNC. Multiple UCC3806s can be synchronized by a single master UCC3806 or external clock.

VC: VC is the input supply connection for the FET drive outputs and has an input range from 2.5 V to 15 V. VC should be capacitively bypassed for proper operation.

VIN: VIN is the input supply connection for this device. The UCC1806 has a maximum startup threshold of 8 V and internally limited by means of a 15 V shunt regulator. The shunted supply current must be limited to 25 mA. For proper operation, VIN must be bypassed to GND with at least a 0.01-μF ceramic capacitor

VREF: VREF is a 5.1 V ±1% trimmed reference output with a 5 mA maximum available current. VREF must be bypassed to GND with at least a 0.1-μF ceramic capacitor for proper operation.

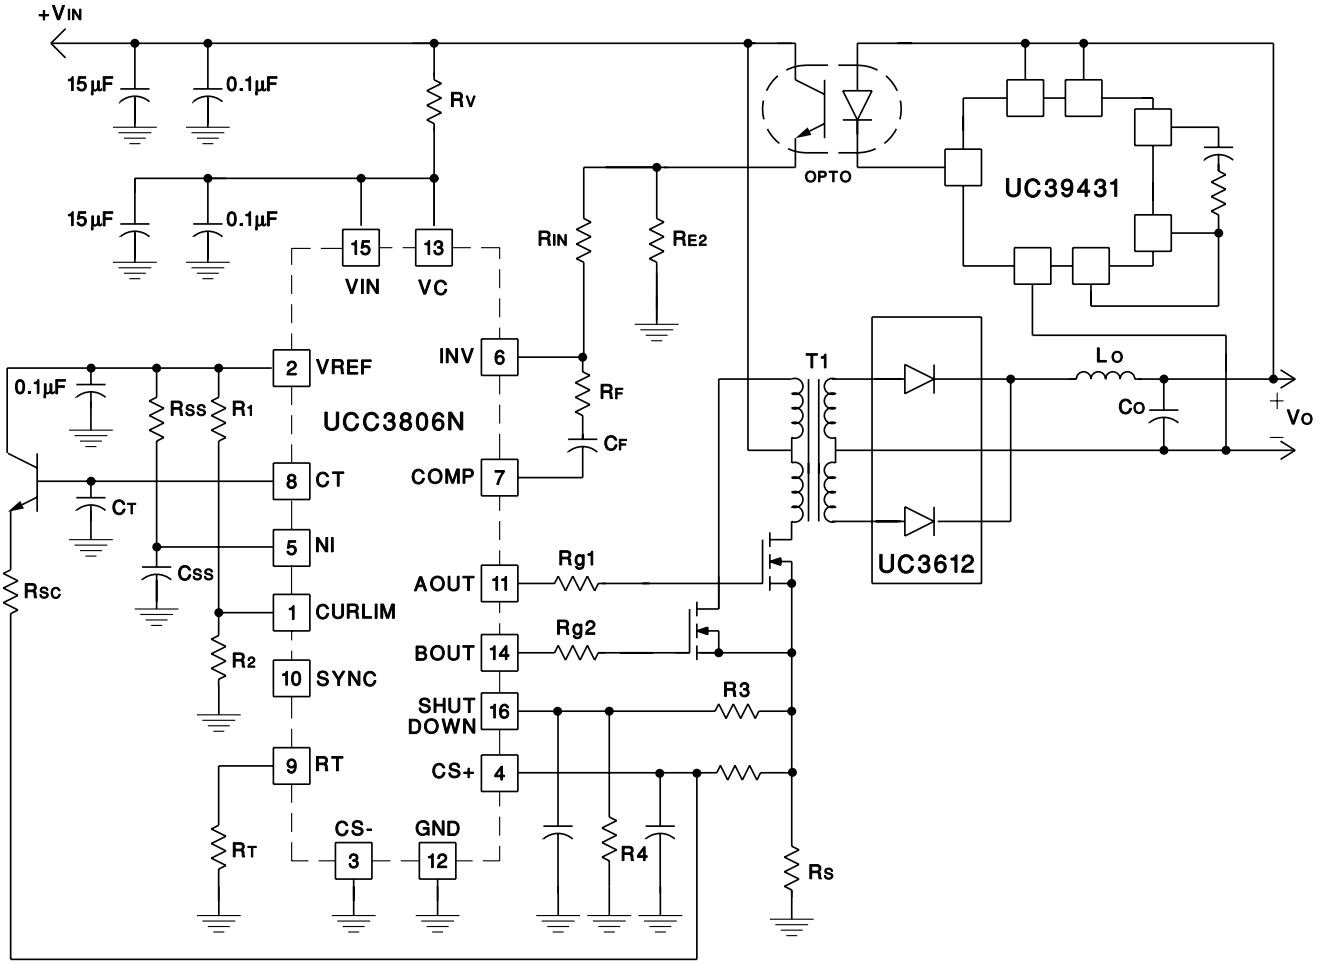
TYPICAL APPLICATION DIAGRAM



UDG-99036

TYPICAL CHARACTERISTICS

Design equations for oscillator are described in the following equations.

$$f_{OSC} = \frac{1}{t_{RAMP} + t_{FALL}} \quad (4)$$

$$t_{RAMP} = 1.92 \times R_T \times C_T \quad (5)$$

$$t_{FALL} = \frac{2.4 \times C_T}{\left(0.002 - \left(\frac{1.25}{R_T}\right)\right)} \quad (6)$$

$$t_{DEAD} = t_{FALL} \quad (7)$$

UCC3806QTR	ACTIVE	PLCC	FN	20	1000	Green (RoHS & no Sb/Br)	CU SN	Level-2-260C-1 YEAR
UCC3806QTRG3	ACTIVE	PLCC	FN	20	1000	Green (RoHS & no Sb/Br)	CU SN	Level-2-260C-1 YEAR

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
