

DP83822 Robust, Low Power 10/100 Mbps Ethernet Physical Layer Transceiver

1 Features

- IEEE 802.3u Compliant: 100BASE-FX, 100BASE-TX and 10BASE-Te
- MII / RMII / RGMII MAC Interfaces
- Low Power Single Supply Options:
 - 1.8-V AVD < 120 mW
 - 3.3-V AVD < 220 mW
- ± 16 -kV HBM ESD Protection
- ± 8 -kV IEC 61000-4-2 ESD Protection
- Start of Frame Detect for IEEE 1588 Time Stamp
- Fast Link-Down Timing
- Auto-Crossover in Force Modes
- Operating Temperature: -40°C to 125°C
- I/O Voltages: 3.3 V, 2.5 V and 1.8 V
- Power Savings Features
 - Energy Efficient Ethernet (EEE) IEEE 802.3az
 - WoL (Wake-on-LAN) Support with Magic Packet Detection
 - Programmable Energy Savings Modes
- Cable Diagnostics
- BIST (Built-in Self-Test)
- MDC / MDIO Interface

2 Applications

- Industrial Networks and Factory Automation
- Motor and Motion Control
- IP Network Cameras
- Building Automation

3 Description

The DP83822 is a low power single-port 10/100 Mbps Ethernet PHY. It provides all physical layer functions needed to transmit and receive data over both standard twisted-pair cables or connect to an external fiber optic transceiver. Additionally, the DP83822 provides flexibility to connect to a MAC through a standard MII, RMII or RGMII interface.

The DP83822 offers integrated cable diagnostic tools, built-in self-test and loopback capabilities for ease of use. It supports multiple industrial buses with its fast link-down timing as well as Auto-MDIX in forced modes.

The DP83822 offers an innovative and robust approach for reducing power consumption through EEE, WoL and other programmable energy savings modes.

The DP83822 is a feature rich and pin-to-pin upgradeable option for the TLK105, TLK106, TLK105L and TLK106L 10/100 Mbps Ethernet PHYs.

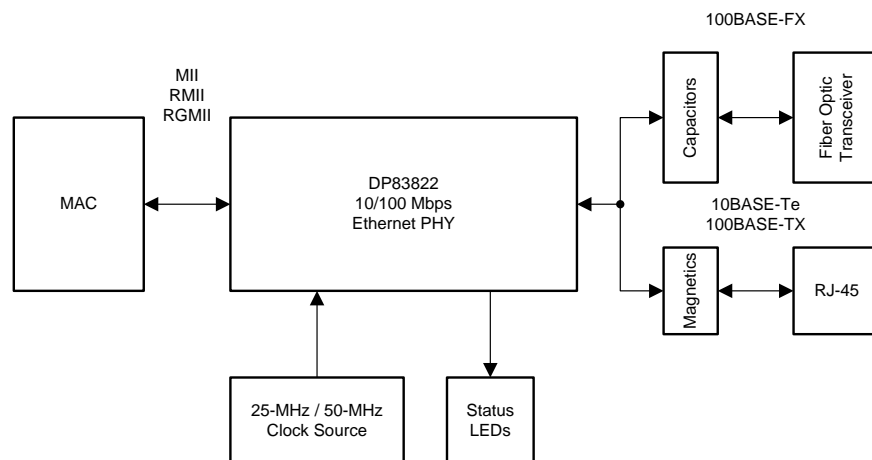

The DP83822 comes in a QFN 32-pin 5.00-mm x 5.00-mm package.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DP83822HF	VQFN (32)	5.00 mm x 5.00 mm
DP83822H	VQFN (32)	5.00 mm x 5.00 mm
DP83822IF	VQFN (32)	5.00 mm x 5.00 mm
DP83822I	VQFN (32)	5.00 mm x 5.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Device Comparison Table

PART NUMBER	100BASE-FX SUPPORT	OPERATING TEMPERATURE
DP83822HF	Yes	-40°C to 125°C
DP83822H	No	-40°C to 125°C
DP83822IF	Yes	-40°C to 85°C
DP83822I	No	-40°C to 85°C

6 Pin Configuration and Functions

The definitions below define the functionality of each pin.

Type: I Input

Type: O Output

Type: I/O Input / Output

Type: PD Internal pulldown

Type: PU Internal pullup

Type: S Strap: Configuration Pin (all configuration pins have weak internal pullups or pulldowns. Use an external voltage divider if you need different configurations at power-up or hardware reset.)

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
MAC INTERFACE			
TX_CLK	2	I, O, PD	<p>MII Transmit Clock: MII Transmit Clock provides a 25-MHz reference clock for 100 Mbps speed and a 2.5-MHz reference clock for 10 Mbps speed. Note that in MII mode, this clock has constant phase referenced to the reference clock. Applications requiring such constant phase may use this feature.</p> <p>Unused in RMII Mode</p> <p>RGMIITransmit Clock: The clock is sourced from the MAC layer to the PHY. When operating at 100 Mbps speed this clock must be 25-MHz. When operating at 10 Mbps speed this clock must be 2.5-MHz.</p>
TX_EN / TX_CTRL	3	I, PD	<p>Transmit Enable: TX_EN is presented on the rising edge of the TX_CLK. TX_EN indicates the presence of valid data inputs on TX_D[3:0] in MII mode and on TX_D[1:0] in RMII mode. TX_EN is an active high signal.</p> <p>RGMIITransmit Control: TX_CTRL combines transmit enable and transmit error signals. TX_EN is presented on the rising edge of TX_CLK and TX_ER on the falling edge of TX_CLK.</p>
TX_D0	4	I, PD	<p>Transmit Data: In MII mode, the transmit data nibble received from the MAC is synchronous to the rising edge of TX_CLK. In RMII mode, TX_D[1:0] received from the MAC is synchronous to the rising edge of the reference clock. In RGMIIMode, the transmit data nibble received from the MAC is synchronous to the rising edge of TX_CLK.</p>
TX_D1	5		
TX_D2	6		
TX_D3	7		
RX_CLK	25	O	<p>MII Receive Clock: MII Receive Clock provides a 25-MHz reference clock for 100 Mbps speed and a 2.5-MHz reference clock for 10 Mbps speed, which is derived from the received data stream.</p> <p>Unused in RMII Mode</p> <p>RGMIIReceive Clock:RGMIIReceive Clock provides a 25-MHz reference clock for 100 Mbps speed and a 2.5-MHz reference clock for 10 Mbps speed, which is derived from the receive data stream.</p>
RX_DV / RX_CTRL	26	O, S, PD	<p>Receive Data Valid: This pin indicates valid data is present on the RX_D[3:0] for MII mode and on RX_D[1:0] in RMII mode, independent from Carrier Sense.</p> <p>RGMIIReceive Control: RX_CTRL combines receive data valid and receive error signals. RX_DV is presented on the rising edge of RX_CLK and RX_ER on the falling edge of RX_CLK.</p>
RX_ER	28	O, S, PU	<p>Receive Error: This pin indicates that an error symbol has been detected within a received packet in both MII and RMII mode. In MII mode, RX_ER is asserted high synchronously to the rising edge of RX_CLK. In RMII mode, RX_ER is asserted high synchronously to the rising edge of the reference clock. This pin is not required to be used by the MAC in MII or RMII because the PHY is corrupting data on a receive error.</p> <p>Unused in RGMIIMode</p>

Pin Functions (continued)

PIN		TYPE	DESCRIPTION
NAME	NO.		
RX_D0	30	O, S, PD	Receive Data: Symbols received on the cable are decoded and presented on these pins synchronous to the rising edge of RX_CLK. They contain valid data when RX_DV is asserted. A nibble RX_D[3:0] is received in MII and RGMII modes. 2-bits RX_D[1:0] is received in RMII Mode. PHY address pins PHY_AD[4:1] are multiplexed with RX_D[3:0], and are pulled-down. PHY_AD[0] (LSB of the address) is multiplexed with COL on pin 29, and is pulled-up. If no external pullup/pulldown is present, the default PHY address is 0x01.
RX_D1	31		
RX_D2	32		
RX_D3 / GPIO3	1		
CRS / CRS_DV	27	O, S, PU	Carrier Sense: In MII mode this pin is asserted high when the receive and/or transmit medium is non-idle. Carrier Sense / Receive Data Valid: In RMII mode, this pin combines the RMII Carrier and Receive Data Valid indications. Unused in RGMII Mode
COL / GPIO2	29	I/O, S, PU	Collision Detect: For Full-Duplex mode, this pin is always LOW. In Half-Duplex mode, this pin is asserted HIGH only when both transmit and receive media are non-idle. Unused in RMII Mode
SERIAL MANAGEMENT INTERFACE			
MDC	20	I	Management Data Clock: Synchronous clock to the MDIO serial management input/output data. This clock may be asynchronous to the MAC transmit and receive clocks. The maximum clock rate is 25-MHz. There is no minimum clock rate.
MDIO	19	I/O	Management Data I/O: Bi-directional management data signal that may be sourced by the management station or the PHY. This pin requires a 2.2kΩ pullup resistor.
$\overline{\text{INT/PWDN}}$	8	I/O	Interrupt / Power Down: Register access is required for this pin to be configured either as power down or as an interrupt. The default function of this pin is power down. When this pin is configured for a power down function, an active low signal on this pin places the device in power down mode. When this pin is configured as an interrupt pin, this pin is asserted low when an interrupt condition occurs. The pin has an open-drain output with a weak internal pullup. Some applications may require an external pullup resistor.
$\overline{\text{RESET}}$	18	I, PU	RESET: This pin is an active low reset input that initializes or re-initializes all the internal registers of the PHY. Asserting this pin low for at least 1μs will force a reset process to occur.
CLOCK INTERFACE			
XI	23	I	Crystal / Oscillator Input MII reference clock: Reference clock 25-MHz ±50 ppm-tolerance crystal or oscillator input. The device supports either an external crystal resonator connected across pins XI and XO, or an external CMOS-level oscillator connected to pin XI only. RMII reference clock: Reference clock 50-MHz ±50 ppm-tolerance CMOS-level oscillator in RMII Slave mode. Reference clock 25-MHz ±50 ppm-tolerance crystal or oscillator in RMII Master mode. RGMII reference clock: Reference clock 25-MHz ±50 ppm-tolerance crystal or oscillator input. The device supports either an external crystal resonator connected across pins XI and XO, or an external CMOS-level oscillator connected to pin XI only.
XO	22	O	Crystal Output: Reference Clock output. XO pin is used for crystal only. This pin should be left floating when a CMOS-level oscillator is connected to XI.
GPIO AND LED INTERFACE			
LED_0	17	O, S, PU	Mode 1 (Default): LINK Indication, LED indicates the status of the link. When the link is good, LED is ON. When the link is down, LED is OFF. Mode 2: ACT Indication, LED indicates transmit and receive activity in addition to the status of the link. The LED is ON when link is good. The LED blinks when the transmitter or receiver is active.

Pin Functions (continued)

PIN		TYPE	DESCRIPTION
NAME	NO.		
LED_1 / GPIO1	24	I/O, PD	Mode 1 (Default): This pin will be tri-state and the pin can be left floating. Mode 2: SPEED Indication, LED indicates the speed of the link. If speed is 100 Mbps, LED is ON. If speed is 10 Mbps, LED is OFF. GPIO1: This pin can be used as a GPIO when using register access.
COL / GPIO2	29	I/O, S, PU	MII Mode: COL pin can be used to drive an LED when operating in Full-Duplex mode. Register access is required for LED configuration. RMII Mode: This pin can be used as an LED when using register access. RGMII Mode: This pin can be used as an LED when using register access. GPIO2: This pin can be used as a GPIO when using register access.
RX_D3 / GPIO3	1	I/O, S, PD	MII Mode: RX_D3 will remain as RX_D3 because it is required for MII mode. RMII Mode: RX_D3 pin can be configured to drive an LED. Register access is required for LED configuration. RGMII Mode: RX_D3 will remain as RX_D3 because it is required for RGMII mode. GPIO3: This pin can be used as a GPIO when using register access.
MEDIA DEPENDENT INTERFACE			
TD_M	11	A	Differential Transmit Output (PMD): These differential outputs can be automatically configured to either 10BASE-Te, 100BASE-TX or 100BASE-FX signaling or forced into a specific signaling mode.
TD_P	12		
RD_M	9	A	Differential Receive Input (PMD): These differential inputs are automatically configured to accept either 10BASE-Te, 100BASE-TX or 100BASE-FX signaling or forced into a specific signaling mode.
RD_P	10		
POWER AND GROUND PINS			
VDDIO	21	P	I/O Supply: 3.3 V, 2.5 V or 1.8 V
AVD	14	P	Analog Supply: 3.3 V or 1.8 V
GND	Ground Pad	P	Ground
RBIAS	16	I	Bias Resistor Connection. A 4.87 kΩ +/-1% resistor must be connected from RBIAS to GND.
OTHER PINS			
NC	13	NC	Leave Floating
NC	15	NC	Leave Floating
LED_1 / GPIO1	24	I/O, PD	Leave Floating if not used as GPIO or LED function

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Input voltage	AVD	-0.3	3.8	V
	VDDIO	-0.3	3.8	
	TD-, TD+, RD-, RD+	-0.3	6	
	Other Inputs	-0.3	3.8	
DC output voltage	All pins	-0.3	3.8	V
T _J	Operating junction temperature		135	°C
T _{stg}	Storage temperature	-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	All pins	±3000	V
		Ethernet network pins (TD+, TD-, RD+, RD-)	±16000	
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	All pins	±1500	
		IEC 61000-4-2 ⁽³⁾	Ethernet network pins (TD+, TD-, RD+, RD-)	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

(3) IEC61000-4-2; 150 pF and 330 Ω, Contact Discharge, Class B.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDDIO	Supply Voltage I/O (1.8V Option)	1.71	1.8	1.89	V
	Supply Voltage I/O (2.5V Option)	2.375	2.5	2.625	
	Supply Voltage I/O (3.3V Option)	3.15	3.3	3.45	
AVD ⁽¹⁾	Supply Voltage Analog (3.3V Option)	3.15	3.3	3.45	V
	Supply Voltage Analog (1.8V Option)	1.71	1.8	1.89	
Center Tap (CT) ⁽¹⁾	Supply Voltage Center Tap (3.3V Option) <i>Magnetic Center Tap</i>	3.15	3.3	3.45	V
	Supply Voltage Analog (1.8V Option) <i>Magnetic Center Tap</i>	1.71	1.8	1.89	
T _A	Ambient Temperature: DP83822I and DP83822IF	-40		85	°C
	Ambient Temperature: DP83822H and DP83822HF	-40		125	

(1) Analog supply (AVD) and magnetic center tap must be at the same potential.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DP83822	UNIT
		VQFN (QFN)	
		32 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	41.0	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	35.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	14.1	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.9	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	14.0	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	5.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
3.3-V VDDIO						
V _{OH}	High level output voltage	I _{OH} = -4 mA VDDIO = 3.3-V ±5%	2.4			V
V _{OL}	low level output voltage	I _{OL} = 4 mA VDDIO = 3.3-V ±5%			0.4	V
V _{IH}	High level input voltage	VDDIO = 3.3-V ±5%	1.7			V
V _{IL}	Low level input voltage	VDDIO = 3.3-V ±5%			0.8	V
2.5-V VDDIO						
V _{OH}	High level output voltage	I _{OH} = -4 mA VDDIO = 2.5-V ±5%	VDDIO × 0.8			V
V _{OL}	Low level output voltage	I _{OL} = 4 mA VDDIO = 2.5-V ±5%			0.4	V
V _{IH}	High level input voltage	VDDIO = 2.5-V ±5%	1.5			V
V _{IL}	Low level input voltage	VDDIO = 2.5-V ±5%			0.7	V
1.8-V VDDIO						
V _{OH}	High level output voltage	I _{OH} = -2 mA VDDIO = 1.8-V ±5%	VDDIO - 0.4			V
V _{OL}	Low level output voltage	I _{OL} = 2 mA VDDIO = 1.8-V ±5%			0.4	V
V _{IH}	High level input voltage	VDDIO = 1.8-V ±5%	1.3			V
V _{IL}	Low level input voltage	VDDIO = 1.8-V ±5%			0.5	V
DC CHARACTERISTICS						
I _{IH}	Input high current (VIN = VCC)	-40°C to 85°C	-10		10	μA
		85°C to 125°C	-20		20	
I _{IL}	Input low current (VIN = GND)	-40°C to 125°C	-10		10	μA
I _{OZ}	TRI-STATE output current (VOUT = VCC, VOUT = GND)	-40°C to 85°C	-10		10	μA
		85°C to 125°C	-20		20	
C _{IN}	Input capacitance ⁽¹⁾			5		pF
C _{OUT}	Output capacitance ⁽¹⁾			5		pF
R _{PU-POR}	Integrated pull-up resistance during latch-in (RESET and Power-Up)	Pins: RX_ER, LED_0, CRS, and COL	37.5	50	62.5	kΩ
R _{Pull-Up}	Integrated pull-up resistance		6.75	9	11.25	kΩ
R _{Pull-Down}	Integrated pull-down resistance		6.75	9	11.25	kΩ
PMD OUTPUTS						
V _{OD}	MDI 10BASE-Te		1.54	1.75	1.96	V _{peak}
V _{OD}	MDI 100BASE-TX		0.95	1	1.05	V _{peak}
V _{ODsym}	MDI 100BASE-TX voltage symmetry		98%	100%	102%	
V _{OD}	MDI 100BASE-FX ⁽¹⁾		0.3	0.5	0.9	V _{peak}

HoldR	Data to Clock input Hold (at Receiver - integrated delay) ⁽³⁾	1	2		ns
Tcyc_10	Clock Cycle Duration 10 Mbps	360	400	440	ns
Tcyc_100	Clock Cycle Duration 100 Mbps	36	40	44	ns
Duty_T	Duty Cycle for 10/100 Mbps ⁽⁴⁾	40%	50%	60%	
Tr / Tf	Rise / Fall Time (20-80%)			750	ps

(1) Ensured by production test, characterization or design.

(2) When operating without RGMII internal delay, the PCB design requires clocks to be routed such that an additional trace delay of greater than 1.5ns is added to the associated clock signal.

(3) Device may operate with or without internal delay.

(4) The duty cycle may be stretched or shrunk during speed changes or while transitioning to a received packet's clock domain as long as minimum duty cycle is not violated and stretching occurs for no more than three Tcyc of the lowest speed transitioned between.

8 Detailed Description

8.1 Overview

The DP83822 is a fully featured single-port Physical Layer transceiver for 10BASE-Te, 100BASE-TX and 100BASE-FX signaling. The device supports the standard Media Independent Interface (MII), Reduced Media Independent Interface (RMII) and Reduced Gigabit Media Independent Interface (RGMI) for direct connection to a Media Access Controller (MAC).

The device is designed for power supply flexibility by allowing for a range of I/O voltage interfaces (3.3 V, 2.5 V or 1.8 V) and options for analog voltage (1.8 V or 3.3 V) to reduced power consumption. Automatic supply configuration within the DP83822 allows for any combination of VDDIO supply and AVD supply without the need for additional configuration settings. The DP83822 uses mixed-signal processing to perform equalization, data recovery, and error correction to achieve robust operation over CAT5 twisted-pair cable. The DP83822 not only meets the requirements of IEEE 802.3u, but maintains high margins in terms of cross-talk and alien noise.

The DP83822 is also a pin-to-pin upgradeable option for the TLK105, TLK106, TLK105L and TLK106L 10/100 Mbps Ethernet PHYs.

8.2 Functional Block Diagram

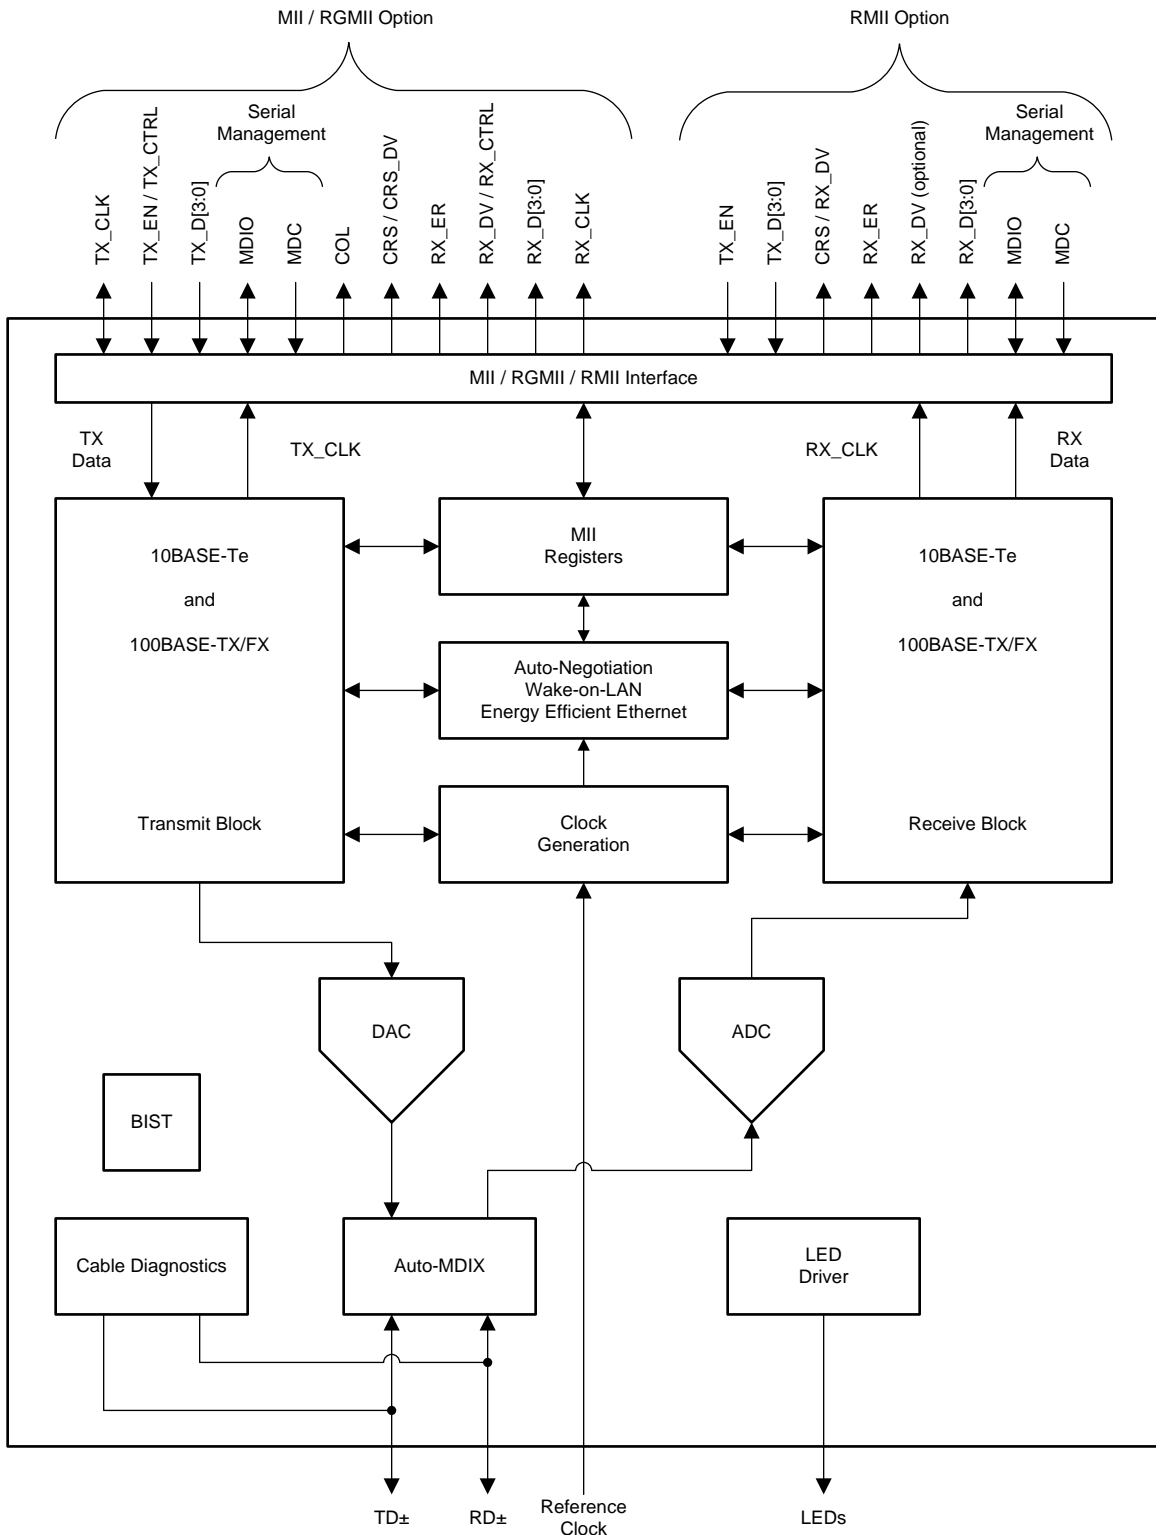

Figure 19. DP83822 Functional Block Diagram

8.3 Feature Description

8.3.1 Energy Efficient Ethernet

8.3.1.1 EEE Overview

Energy Efficient Ethernet (EEE), defined by IEEE 802.3az, is a capability integrated into Layer 1 (Physical Layer) and Layer 2 (Data Link Layer) to operate in Low Power Idle (LPI) mode. In LPI mode, power is saved during periods of low packet utilization. EEE defines the protocol to enter and exit LPI mode without dropping the link or corrupting packets. The transition time into and out of LPI mode is short enough to be transparent to the upper layers within the OSI model.

The DP83822 EEE supports 100 Mbps and 10 Mbps speeds. In 10BASE-T_e operation, EEE operates with a reduced transmit amplitude that is fully interoperable with a 10BASE-T PHY.

8.3.1.2 EEE Negotiation

EEE is advertised during Auto-Negotiation. Auto-Negotiation is performed at power-up, on management command, after link failure, or due to user intervention. EEE is supported if and only if both link partners advertise EEE capabilities. If EEE is not supported, all EEE functions are disabled and the MAC should not assert LPI. To advertise EEE capabilities, the PHY needs to exchange an additional formatted next page and unformatted next page in sequence.

EEE Negotiation can be activated in two ways:

- Hardware Bootstrapping
- Register Access

EEE Negotiation Advertisements can be activated using RX_D1 pin bootstrap. When RX_D1 is set to strap mode 2 or mode 3, EEE capabilities will be advertised during the Auto-Negotiation process. EEE Negotiation Advertisements can also be activated using register access through the SMI. The DP83822 offers two different ways of accessing EEE control registers within the PHY register set. IEEE 802.3az defines MMD3 and MMD7 as the locations for EEE control and status registers. The MMD3 and MMD7 registers 0x3000, 0x3001, 0x3016, 0x703C and 0x703D contain all the required controls and status indications for operating EEE. Additionally, the DP83822 supports an EEE configuration bypass option that enables EEE control registers within Texas Instruments' Vendor Specific DEVAD. This helps simplify configuration by allowing for a single DEVAD to be used. The Energy Efficient Ethernet Configuration Register #2 (EEECFG2, address 0x04D0) contains controls for enabling and selecting the pin allocation for TX_ER, which is part of the MAC transmit LPI command. The Energy Efficient Ethernet Configuration Register #3 (EEECFG3, address 0x04D1) contains controls for EEE configuration bypass.

8.3.2 Wake-on-LAN Packet Detection

Wake-on-LAN provides a mechanism to detect specific frames and notify the connected controller through either register status change, GPIO indication or an interrupt flag. The WoL feature within the DP83822 allows for connected devices residing above the Physical Layer to remain in a low power state until frames with the qualifying credentials are detected. Supported WoL frame types include: Magic Packet, Magic Packet with Secure-ON and Custom Pattern Match. When a qualifying WoL frame is received, the DP83822 WoL logic circuit is able to generate a user defined event (either pulses or level change) through any of the GPIO pins or a status interrupt flag to inform a connected controller that a wake event has occurred. Additionally, the DP83822 includes a CRC Gate to prevent invalid packets from triggering a wake-up event.

The Wake-on-LAN feature set includes:

- Identification of WoL frames in all supported speeds (100BASE-FX, 100BASE-TX and 10BASE-T_e).
- Wakeup interrupt generation upon reception of a WoL frame.
- CRC error checking of WoL frames to prevent interrupt generation from invalid frames.
- Magic Packets with Secure-ON password and 64-byte Custom Pattern Match for security.

8.3.2.1 Magic Packet Structure

When configured for Magic Packet detection, the DP83822 scans all incoming frames addressed to the node for a specific data sequence. This sequence identifies the frame as a Magic Packet frame.

Feature Description (continued)

A Magic Packet frame must also meet the basic requirements for the LAN technology chosen, such as SOURCE ADDRESS, DESTINATION ADDRESS (which may be the receiving station's IEEE address or a BROADCAST ADDRESS), and CRC.

The specific Magic Packet sequence consists of 16 duplications of the MAC address of this node, with no breaks or interruptions, followed by Secure-ON password if security is enabled. This sequence can be located anywhere within the packet, but must be preceded by a synchronization stream. The synchronization stream is defined as 6-bytes of 0xFF.

Figure 20. Magic Packet Structure

8.3.2.2 Magic Packet Example

The following is an example Magic Packet for a Destination Address of 11h 22h 33h 44h 55h 66h and a secure-on password 2Ah 2Bh 2Ch 2Dh 2Eh 2Fh:

```

```

8.3.2.3 Wake-on-LAN Configuration and Status

Wake-on-LAN functionality is configured via the Receive Configuration Register (RXFCFG, address 0x04A0). Wake-on-LAN status is reported in the Recieve Status Register (RXFS, address 0x04A1). Wake-on-LAN interrupt flag configuration and status is located in the MII Interrupt Status Register #2 (MISR2, address 0x0013).

Feature Description (continued)

8.3.3 Start of Frame Detect for IEEE 1588 Time Stamp

The DP83822 supports an IEEE 1588 indication pulse at the SFD (start frame delimiter) for receive and transmit paths. The pulse can be delivered to any of the following pins: LED_0, LED_1 (GPIO1), COL (GPIO2), RX_D3 (GPIO3), INT/PWDN_N and CRS. The 1588 Time Stamp pulse indicates the actual time the symbol is presented on the lines (for transmit), or the first symbol received (for receive). The exact timing of the pulse can be adjusted via the IEEE 1588 PTP Configuration Register (PTPCFG, address 0x003F). Each increment of phase value is an 8-ns step.

Figure 21. IEEE 1588 Message Timestamp Point

There are three registers that are able to control the routing of the IEEE 1588 transmit and receive indications. The IEEE 1588 PTP Pin Select Register (PTPPSEL, address 0x003E) is able to route both transmit and receive indications to LED_0 (GPIO1), COL (GPIO2), CRS and INT/PWDN_N, which is also found in the TLK105L and TLK106L PHYs. Two additional registers in the DP83822 allow for additional pin selections and a centralized location for GPIO controls through the use of the IO MUX GPIO Control Register #1 and #2 (IOCTRL1 and IOCTRL2, address 0x0462 and address 0x0463).

8.3.4 Clock Output

The DP83822 has several clock configuration options. An external crystal or CMOS-level oscillator provides the stimulus for the internal PHY reference clock. The local reference clock acts as the central source for all clocking within the device, excluding the pass-through clock option.

All clock configuration options are enabled using the DP83822 IO MUX GPIO Control Register #1 and #2 (IOCTRL1 IOCTRL2, address 0x0462 bits[14:12] for RX_D3 (GPIO3), address 0x0462 bits[6:4] for LED_1 (GPIO1), address 0x0463 bits[6:4] for COL (GPIO2)).

Clock options supported by the DP83822 include:

- MAC IF Clock
- XI Clock
- Free Running Clock
- Recovered Clock

MAC IF Clock will operate at the same rate as the MAC interface selected. For MII operation, MAC IF Clock frequency is 25-MHz. For RMII operation, MAC IF Clock frequency is 50-MHz. For RGMII operation, MAC IF Clock frequency is 25-MHz. XI Clock is a pass-through option, which allows for the XI pin clock to be passed to a GPIO pin. Please note that the clock is buffered prior to transmission out of the GPIOs, and output clock amplitude will be at the selected VDDIO level. Free Running Clock is an internally generated 125-MHz free running clock. Recovered Clock is a 125-MHz recovered clock from a connected link partner.

8.4 Device Functional Modes

8.4.1 MAC Interfaces

8.4.1.1 Media Independent Interface (MII)

The Media Independent Interface is a synchronous 4-bit wide nibble data interface that connects the PHY to the MAC in 100BASE-FX, 100BASE-TX and 10BASE-Te modes. The MII is fully compliant with IEEE 802.3-2002 clause 22.

The MII signals are summarized below:

Table 1. MII Signals

FUNCTION	PINs
Data Signals	TX_D[3:0]
	RX_D[3:0]
Transmit and Receive Signals	TX_EN
	RX_DV
Line-Status Signals	CRS
	COL

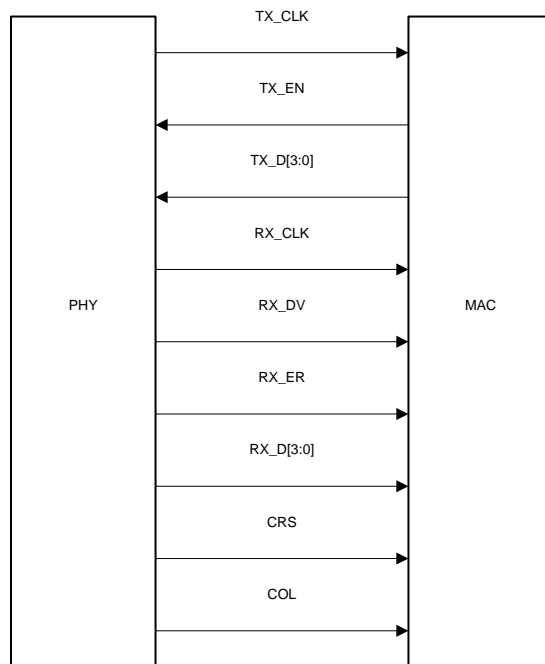

Figure 22. MII Signaling

Additionally, the MII interface includes the carrier sense signal (CRS), as well as a collision detect signal (COL). The CRS signal asserts to indicate the reception or transmission of data. The COL signal asserts as an indication of a collision which can occur during Half-Duplex mode when both transmit and receive operations occur simultaneously.

8.4.1.2 Reduced Media Independent Interface (RMII)

The DP83822 incorporates the Reduced Media Independent Interface (RMII) as specified in the RMII specification from the RMII consortium. The purpose of this interface is to provide a reduced pin count alternative to the IEEE 802.3u MII as specified in Clause 22. Architecturally, the RMII specification provides an additional reconciliation layer on either side of the MII, but can be implemented in the absence of an MII. The DP83822 offers two types of RMII operations: RMII Slave and RMII Master. In RMII Slave operation, the DP83822 operates off of a 50-MHz CMOS-level oscillator connected to the XI pin and shares the same clock as the MAC. In RMII Master operation, the DP83822 operates off of either a 25-MHz CMOS-level oscillator connected to XI pin or a 25-MHz crystal connected across XI and XO pins. A 50-MHz output clock referenced from any of the three DP83822 GPIOs is connected to the MAC. Please note that if RMII Master mode is configured through bootstraps, a 50-MHz output clock will automatically be enabled on RX_D3 (GPIO3).

The RMII specification has the following characteristics:

- Supports 100BASE-FX, 100BASE-TX and 10BASE-Te.
- Single clock reference sourced from the MAC to PHY (or from an external source)
- Provides independent 2-bit wide transmit and receive data paths
- Uses CMOS signal levels, the same levels as the MII interface

In this mode, data transfers are two bits for every clock cycle using the internal 50-MHz reference clock for both transmit and receive paths.

The RMII signals are summarized below:

Table 2. RMII Signals

FUNCTION	PINs
Data Signals	TX_D[1:0]
	RX_D[1:0]
Transmit and Receive Signals	TX_EN
	CRS_DV

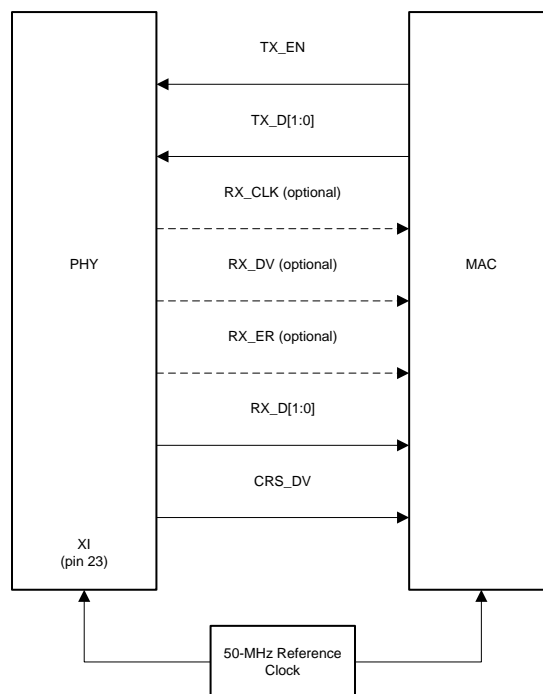

Figure 23. RMII Slave Signaling

Figure 24. RMII Master Signaling

Data on TX_D[1:0] are latched at the PHY with reference to the clock edges on the XI pin. Data on RX_D[1:0] are latched at the MAC with reference to the same clock edges on the XI pin. RMII operates at the same speed in 10BASE-Te, 100BASE-TX and 100BASE-FX. In 10BASE-Te the data is 10 times slower than the reference clock, so transmit data is sampled every 10 clock cycles. Likewise, receive data is generated on every 10th clock so that an attached MAC device can sample the data every 10 clock cycles.

In addition, RMII mode supplies an RX_DV signal that allows a simpler method of recovering receive data without the need to separate RX_DV from the CRS_DV indication. RX_ER is also supported even though it is not required by the RMII specification.

RMII includes a programmable elastic buffer to adjust for the frequency differences between the reference clock and the recovered receive clock. The programmable elastic buffer minimizes internal propagation delay based on expected maximum packet size and clock accuracy.

Table below indicates how to program the buffer FIFO based on the expected maximum packet size and clock accuracy. It assumes that the RMII reference clock and the far-end transmitter clock have the same accuracy.

Table 3. Recommended RMII Packet Sizes

START THRESHOLD RBR[1:0]	LATENCY TOLERANCE	RECOMMENDED PACKET SIZE AT ±50 ppm	RECOMMENDED PACKET SIZE AT ±100 ppm
1 (4-bits)	2 bits	2400 bytes	1200 bytes
2 (8-bits)	6 bits	7200 bytes	3600 bytes
3 (12-bits)	10 bits	12000 bytes	6000 bytes
4 (16-bits)	14 bits	16800 bytes	8400 bytes

8.4.1.3 Reduced Gigabit Media Independent Interface (RGMI)

The DP83822 also supports Reduced Gigabit Media Independent Interface (RGMI) as specified by RGMI version 2.0. RGMI is designed to reduce the number of pins required to connect the MAC and PHY. To accomplish this goal, the control signals are multiplexed. Both rising and falling edges of the clock are used to sample the control signal pin on the transmit and receive paths. For 10 Mbps operation, RX_CLK and TX_CLK operate at 2.5-MHz. For 100 Mbps operation, RX_CLK and TX_CLK operate at 25-MHz.

The RGMI signals are summarized below:

Table 4. RGMI Signals

FUNCTION	PINs
Data Signals	TX_D[3:0]
	RX_D[3:0]
Transmit and Receive Signals	TX_CTRL
	RX_CTRL

Figure 25. RGMI Signaling

During packet reception, RX_CLK may be stretched on either the positive or negative pulse to accommodate the transition from the internal free running clock to a recovered clock (data synchronous). Additionally, when the speed of the PHY changes, a similar clock stretching of the positive or negative pulses is allowed to prevent clock glitches. Data may be duplicated on the falling edge of the clock because double data rate (DDR) is only required for 1 Gbps operation, which is not supported by the DP83822.

The DP83822 supports in-band status indication. To help simplify detection of link status, speed and duplex, the DP83822 provides inter-frame signals on RX_D[3:0] pins as specified in Table 5 below.

Table 5. RGMI In-Band Status

RX_DV	RX_D3	RX_D[2:1]	RX_D0
0 Note: In-band status only valid when RX_DV is low	Duplex Status: 1 = Full-Duplex 0 = Half-Duplex	RX_CLK Clock Speed: 00 = 2.5-MHz (10 Mbps) 01 = 25-MHz (100 Mbps) 10 = Reserved 11 = Reserved	Link Status: 1 = Valid link established 0 = Link not established

8.4.2 Serial Management Interface

The Serial Management Interface provides access to the DP83822 internal register space for status information and configuration. The SMI is compatible with IEEE 802.3 clause 22 and clause 45. The implemented register set consists of the registers required by the IEEE 802.3 plus several others to provide additional visibility and controllability of the DP83822.

The SMI includes the management clock (MDC) and the management input/output data pin (MDIO). MDC is sourced by the external management entity, also called Station (STA), and can run at a maximum clock rate of 25-MHz. MDC is not expected to be continuous, and can be turned off by the external management entity when the bus is idle.

MDIO is sourced by the external management entity and by the PHY. The data on the MDIO pin is latched on the rising edge of the MDC. MDIO pin requires a pullup resistor (2.2 K Ω), which pulls MDIO high during IDLE and turnaround.

Up to 32 PHYs can share a common SMI bus. To distinguish between the PHYs, a 5-bit address is used. During power-up or hardware reset, the DP83822 latches the PHY_AD[4:0] configuration pins to determine its address.

The management entity must not start an SMI transaction in the first cycle after power-up or hardware reset. To maintain valid operation, the SMI bus must remain inactive at least one MDC cycle after reset is deasserted. In normal MDIO transactions, the register address is taken directly from the management-frame reg_addr field, thus allowing direct access to 32 16-bit registers (including those defined in IEEE 802.3 and vendor specific). The data field is used for both reading and writing. The Start code is indicated by a <01> pattern. This pattern makes sure that the MDIO line transitions from the default idle line state. Turnaround is defined as an idle bit time inserted between the Register Address field and the Data field. To avoid contention during a read transaction, no device may actively drive the MDIO signal during the first bit of Turnaround. The addressed DP83822 drives the MDIO with a zero for the second bit of turnaround and follows this with the required data.

For write transactions, the station-management entity writes data to the addressed DP83822, thus eliminating the requirement for MDIO Turnaround. The Turnaround time is filled by the management entity by inserting <10>.

Table 6. SMI Protocol

SMI PROTOCOL	<idle><start><op code><device addr><reg addr><turnaround><data><idle>
Read Operation	<idle><01><10><AAAA><RRRRR><Z0><XXXX XXXX XXXX XXXX><idle>
Write Operation	<idle><01><01><AAAA><RRRRR><10><XXXX XXXX XXXX XXXX><idle>

8.4.2.1 Extended Register Space Access

The DP83822 SMI function supports read/write access to the extended register set using the Register Control Register (REGCR, address 0x000D) and the Data Register (ADDAR, address 0x000E) and the MDIO Manageable Device (MMD) indirect method defined in IEEE 802.3ah Draft for Clause 22 for accessing the Clause 45 extended register set.

The standard register set, MDIO registers 0 to 31, is accessed using the normal direct-MDIO access or the indirect method, except for register REGCR and register ADDAR, which are accessed only using the normal MDIO transaction. The SMI function will ignore indirect access to these registers.

REGCR is the MMD access control. In general, register REGCR[4:0] is the device address DEVAD that directs any accesses of the ADDAR register to the appropriate MMD.

The DP83822 supports three MMD device addresses:

1. The Vendor-Specific device address DEVAD[4:0] = “11111” is used for general MMD register accesses.
2. DEVAD[4:0] = “00011” is used for Energy Efficient Ethernet MMD register accesses. Register names for registers accessible at this device address are preceded by MMD3.
3. DEVAD[4:0] = “00111” is used for Energy Efficient Ethernet MMD registers accesses. Register names for registers accessible at this device address are preceded by MMD7.

All accesses through register REGCR and ADDAR must use the correct DEVAD. Transactions with other DEVAD are ignored. REGCR[15:14] holds the access function: address (00), data with no post increment (01), data with post increment on read and writes (10) and data with post increment on writes only (11).

- ADDAR is the address/data MMD register. ADDAR is used in conjunction with REGCR to provide the access to the extended register set. If register REGCR[15:14] is (00), then ADDAR holds the address of the extended address space register. Otherwise, ADDAR holds the data as indicated by the contents of its address register. When REGCR[15:14] is set to (00), accesses to register ADDAR modify the extended register set address register. This address register must always be initialized in order to access any of the registers within the extended register set.
- When REGCR[15:14] is set to (01), accesses to register ADDAR access the register within the extended register set selected by the value in the address register.
- When REGCR[15:14] is set to (10), access to register ADDAR access the register within the extended register set selected by the value in the address register. After that access is complete, for both reads and writes, the value in the address register is incremented.
- When REGCR[15:14] is set to (11), access to register ADDAR access the register within the extended register set selected by the value in the address register. After that access is complete, for write access only, the value in the address register is incremented. For read accesses, the value of the address register remains unchanged.

The following sections describe how to perform operations on the extended register set using register REGCR and ADDAR. The descriptions use the device address for general MMD register accesses (DEVAD[4:0] = “11111”). For register accesses to the MMD3 or MMD7 registers the corresponding device address would be used.

8.4.2.2 Write Address Operation

To set the address register:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the register address to register ADDAR.

Subsequent writes to register ADDAR (step 2) continue to write the address register.

8.4.2.3 Read Address Operation

To read the address register:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Read the register address from register ADDAR.

Subsequent reads to register ADDAR (step 2) continue to read the address register.

8.4.2.4 Write (No Post Increment) Operation

To write a register in the extended register set:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x401F (data, no post increment function field = 01, DEVAD = 31) to register REGCR.
4. Write the content of the desired extended register set to register ADDAR.

Subsequent writes to register ADDAR (step 4) continue to rewrite the register selected by the value in the address register.

NOTE

Steps (1) and (2) can be skipped if the address register was previously configured.

8.4.2.5 Read (No Post Increment) Operation

To read a register in the extended register set:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x401F (data, no post increment function field = 01, DEVAD = 31) to register REGCR.
4. Read the content of the desired extended register set in register ADDAR.

Subsequent reads to register ADDAR (step 4) continue to reading the register selected by the value in the address register.

NOTE

Steps (1) and (2) can be skipped if the address register was previously configured.

8.4.2.6 Write (Post Increment) Operation

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x801F (data, post increment function field = 10, DEVAD = 31) or the value 0xC01F (data, post increment on writes function field = 11, DEVAD = 31) to register REGCR.
4. Write the content of the desired extended register set to register ADDAR.

Subsequent writes to register ADDAR (step 4) write the next higher addressed data register selected by the value of the address register; the address register is incremented after each access.

8.4.2.7 Read (Post Increment) Operation

To read a register in the extended register set and automatically increment the address register to the next higher value following the write operation:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x801F (data, post increment function field = 10, DEVAD = 31) to register REGCR.
4. Read the content of the desired extended register set in register ADDAR.

Subsequent reads to register ADDAR (step 4) read the next higher addressed data register selected by the value of the address register; the address register is incremented after each access.

8.4.2.8 Example Write Operation (No Post Increment)

The following example will demonstrate a write operation with no post increment. In this example, the MAC impedance will be adjusted to 99.25 Ω using the IO MUX GPIO Control Register (IOCTRL, address 0x0461).

1. Write the value 0x001F to register 0x000D.
2. Write the value 0x0461 to register 0x000E. (Sets desired register to the IOCTRL)
3. Write the value 0x401F to register 0x000D.
4. Write the value 0x0400 to register 0x000E. (Sets MAC impedance to 99.25 Ω)

8.4.2.9 Example Read Operation (No Post Increment)

The following example will demonstrate a read operation with no post increment. In this example, the MMD7 Energy Efficient Ethernet Link Partner Ability Register (MMD7_EEE_LP_ABILITY, address 0x703D) will be read.

1. Write the value 0x0007 to register 0x000D.
2. Write the value 0x003D to register 0x000E. (Sets desired register to the MMD7_EEE_LP_ABILITY)
3. Write the value 0x4007 to register 0x000D.
4. Read the value of register 0x000E. (Data read is the value contained within the MMD7_EEE_LP_ABILITY)

8.4.3 100BASE-TX

8.4.3.1 100BASE-TX Transmitter

The 100BASE-TX transmitter consists of several functional blocks which convert synchronous 4-bit nibble data, as provided by the MII, to a scrambled MLT-3 125 Mbps serial data stream on the MDI. 4B5B encoding and decoding is detailed in [Table 7](#) below.

The transmitter section consists of the following functional blocks:

1. Code-Group Encoder and Injection Block
2. Scrambler Block with Bypass Option
3. NRZ to NRZI Encoder Block
4. Binary to MLT-3 Converter / Common Driver Block

The bypass option for the functional blocks within the 100BASE-TX transmitter provides flexibility for applications where data conversion is not always required. The DP83822 implements the 100BASE-TX transmit state machine diagram as specified in the IEEE 802.3u Standard, Clause 24.

Table 7. 4B5B Code-Group Encoding / Decoding

NAME	PCS 5B CODE-GROUP	MII 4B NIBBLE CODE

(1) Control code-groups I, J, K, T and R in data fields will be mapped as invalid codes, together with RX_ER asserted.

(2) Energy Efficient Ethernet LPI must also have TX_ER / RX_ER asserted and TX_EN / RX_DV deasserted.

8.4.3.1.1 Code-Group Encoding and Injection

The code-group encoder converts 4-bit (4B) nibble data generated by the MAC into 5-bit (5B) code-groups for transmission. This conversion is required to allow control data to be combined with packet data code-groups. Refer to [Table 7](#) for 4B to 5B code-group mapping details.

The code-group encoder substitutes the first 8-bits of the MAC preamble with a J/K code-group pair (11000 10001) upon transmission. The code-group encoder continues to replace subsequent 4B preamble and data nibbles with corresponding 5B code-groups. At the end of the transmit packet, upon the deassertion of transmit enable (TX_EN) signal from the MAC, the code-group encoder injects the T/R code-group pair (01101 00111) indicating the end of the frame.

After the T/R code-group pair, the code-group encoder continuously injects IDLEs into the transmit data stream until the next transmit packet is detected (reassertion of transmit enable).

8.4.3.1.2 Scrambler

The scrambler is required to control the radiated emissions at the media connector and on the twisted-pair cable. By scrambling the data, the total energy launched onto the cable is randomly distributed over a wide frequency range. Without the scrambler, energy levels at the MDI and on the cable could peak beyond FCC limitations at frequencies related to repeating 5B sequences (that is, continuous transmission of IDLEs).

The scrambler is configured as a closed loop linear feedback shift register (LFSR) with an 11-bit polynomial. The output of the closed loop LFSR is X-ORd with the serial NRZ data from the code-group encoder. The result is a scrambled data stream with sufficient randomization to decrease radiated emissions at certain frequencies by as much as 20 dB.

8.4.3.1.3 NRZ to NRZI Encoder

After the transmit data stream has been serialized and scrambled, the data must be NRZI encoded in order to comply with the TP-PMD standard for 100BASE-TX transmission over Category-5 Unshielded twisted pair cable. There is no ability to bypass this block within the DP83822. The NRZI data is sent to the 100 Mbps Driver.

8.4.3.1.4 Binary to MLT-3 Converter

The Binary to MLT-3 conversion is accomplished by converting the serial binary data stream output from the NRZI encoder into two binary data streams with alternately phased logic one events. These two binary streams are then fed to the twisted pair output driver which converts the voltage to current and alternately drives either side of the transmit transformer primary winding, resulting in a minimal current MLT-3 signal.

The 100BASE-TX MLT-3 signal sourced by the PMD Output Pair common driver is slew rate controlled. This should be considered when selecting AC coupling magnetics to ensure TP-PMD Standard compliant transition times ($3 \text{ ns} < \text{Trise/fall} < 5 \text{ ns}$).

The 100BASE-TX transmit TP-PMD function within the DP83822 is capable of sourcing only MLT-3 encoded data. Binary output from the PMD Output Pair is not possible in 100 Mbps mode.

8.4.3.2 100BASE-TX Receiver

The 100BASE-TX receiver consists of several functional blocks which convert the scrambled MLT-3 125 Mbps serial data stream to synchronous 4-bit nibble data that is provided to the MII.

The receive section consists of the following functional blocks:

1. Input and BLW Compensation
2. Signal Detect
3. Digital Adaptive Equalization
4. MLT-3 to Binary Decoder
5. Clock Recovery Module
6. NRZI to NRZ Decoder
7. Serial to Parallel
8. Descrambler
9. Code-Group Alignment

10. 4B/5B Decoder
11. Link Integrity Monitor
12. Bad SSD Detection

8.4.4 100BASE-FX

The DP83822 provides IEEE 802.3 compliant 100BASE-FX operation. Hardware bootstrap or register configuration can be used to enable 100BASE-FX operation.

8.4.4.1 100BASE-FX Transmit

In 100BASE-FX mode, the DP83822 transmit pins connect to an industry standard fiber transceiver through a capacitively coupled circuit. During 100BASE-FX operation, the DP83822 transmit path will bypass the scrambler and MLT-3 encoder so that only serialized 4B5B encoded NRZI data is transmitted at 125-MHz.

8.4.4.2 100BASE-FX Receive

In 100BASE-FX mode, the DP83822 receive pins connect to an industry standard fiber transceiver through a capacitively coupled circuit. During 100BASE-FX operation, the DP83822 receive path will bypass the MLT-3 decoder and scrambler. This allows for reception of serialized 4B5B encoded NRZI data at 125-MHz.

The DP83822 also has the added feature of a signal detection pin for direct connection to an industry standard fiber transceiver. When enabling 100BASE-FX operation using the FX_EN bootstrap, AMDIX_EN bootstrap turns into SD_DIS bootstrap. If 100BASE-FX operation is enabled by setting FX_EN to either bootstrap mode 2 or 3, SD_DIS will enable signal detection pin, LED_1, when SD_DIS is set to either bootstrap mode 1 or 2. Please see [Table 10](#) for mode information regarding hardware bootstraps.

Note: 100BASE-FX signal detect pin (LED_1) polarity is controlled by bit[0] in the General Configuration Register (GENCFG, address 0x0465). By default, signal detect is an active LOW polarity.

8.4.5 10BASE-Te

The 10BASE-Te transceiver module is IEEE 802.3 compliant. It includes the receiver, transmitter, collision, heartbeat, loopback, jabber, and link integrity functions, as defined in the standard.

8.4.5.1 Squelch

Squelch is responsible for determining when valid data is present on the differential receive inputs. The squelch circuitry employs a combination of amplitude and timing measurements (as specified in the IEEE 802.3 10BASE-Te standard) to determine the validity of data on the twisted-pair inputs.

The signal at the start of a packet is checked by the squelch, and any pulses not exceeding the squelch level (either positive or negative, depending upon polarity) are rejected. When this first squelch level is exceeded correctly, the opposite squelch level must then be exceeded no earlier than 50ns. Finally, the signal must again exceed the original squelch level no earlier than 50ns to qualify as a valid input waveform, and not be rejected. This checking procedure results in the typical loss of three preamble bits at the beginning of each packet. When the transmitter is operating, five consecutive transitions are checked before indicating that valid data is present. At this time, the squelch circuitry is reset.

8.4.5.2 Normal Link Pulse Detection and Generation

The link pulse generator produces pulses as defined in the IEEE 802.3 10BASE-Te standard. Each link pulse is nominally 100 ns in duration and transmitted every 16 ms in the absence of transmit data. Link pulses are used to check the integrity of the connection with the remote end.

8.4.5.3 Jabber

Jabber is a condition in which a station transmits for a period of time longer than the maximum permissible packet length, usually due to a fault condition. The jabber function monitors the DP83822 output and disables the transmitter if it attempts to transmit a packet of longer than legal size. A jabber timer monitors the transmitter and disables the transmission if the transmitter is active for approximately 100ms. When disabled by the Jabber function, the transmitter stays disabled for the entire time that the module's internal transmit enable is asserted. This signal must be de-asserted for approximately 500ms (unjab time) before the Jabber function re-enables the transmit outputs. The Jabber function is only available and active in 10BASE-Te mode.

8.4.5.4 Active Link Polarity Detection and Correction

Swapping the wires within the twisted-pair causes polarity errors. Wrong polarity affects 10BASE-T_e connections. 100BASE-TX is immune to polarity problems because it uses MLT-3 encoding. 10BASE-T_e receive block automatically detects reversed polarity.

8.4.6 Auto-Negotiation (Speed / Duplex Selection)

Auto-Negotiation provides a mechanism for exchanging configuration information between the two ends of a link segment. This mechanism is implemented by exchanging Fast Link Pulses (FLP). FLPs are burst pulses that provide the information used to communicate the abilities between two devices at each end of a link segment. The DP83822 supports 100BASE-TX and 10BASE-T_e modes of operation for Auto-Negotiation. 100BASE-FX is not included in the Auto-Negotiation process. Auto-Negotiation ensures that the highest performance protocol is selected based on the advertised abilities of the Link Partner and the local device. Auto-Negotiation can be enabled or disabled in hardware, using the AN_EN bootstrap, or by register configuration, using bit[12] in the Basic Mode Control Register (BMCR, address 0x0000). For further details regarding Auto-Negotiation, refer to Clause 28 of the IEEE 802.3 specification.

8.4.7 Auto-MDIX Resolution

The DP83822 can determine if a “straight” or “crossover” cable is used to connect to the Link Partner. It can automatically re-assign channel A and B to establish link with the Link Partner. Auto-MDIX resolution precedes the actual Auto-Negotiation process that involves exchange of FLPs to advertise capabilities. Automatic MDI/MDIX is described in IEEE 802.3 Clause 40, section 40.8.2. It is not a required implementation for 10BASE-T_e and 100BASE-TX. Auto-MDIX can also be used when operating the PHY in Forced modes.

Auto-MDIX can be enabled or disabled in hardware, using the AMDIX bootstrap, or by register configuration, using bit[15] of the PHY Control Register (PHYCR, address 0x0019). When Auto-MDIX is disabled, the PMA is forced to either MDI (“straight”) or MDIX (“crossover”). Manual configuration of MDI or MDIX can also be accomplished in hardware, using the AMDIX bootstrap, or by register configuration, using bit[14] of the PHYCR. Additionally, the DP83822 supports Fast Auto-MDIX configuration via register configuration to enable faster MDIX resolution for link establishment. Fast Auto-MDIX can be enabled using bit[6] in the Control Register #1 (CR1, address 0x0009).

8.4.8 Loopback Modes

There are several loopback options within the DP83822 that test and verify various functional blocks within the PHY. Enabling loopback modes allow for in-circuit testing of the digital and analog data paths. The DP83822 may be configured to any one of the Near-End Loopback modes or to the Far-End (reverse) Loopback mode. MII Loopback is configured using the Basic Mode Control Register (BMCR, address 0x0000). All other loopback modes are enabled using the BIST Control Register (BISCR, address 0x0016). Except where otherwise noted, loopback modes are supported for all speeds (10/100 Mbps and all MAC interfaces).

Figure 26. Loopback Test Modes

8.4.8.1 Near-End Loopback

Near-End Loopback provides the ability to loop the transmitted data back to the receiver via the digital or analog circuitry. The point at which the signal is looped back is selected using loopback control bits[3:0] in the BISCR register. Auto-Negotiation and Auto-MDIX should be disabled before selecting the Near-End Loopback modes. This constraint does not apply for external-loopback mode.

8.4.8.2 MII Loopback

MI I Loopback is the shallowest loop through the PHY. It is a useful test mode to validate communications between the MAC and the PHY. When in MII Loopback, data transmitted from a connected MAC on the TX path is internally looped back in the DP83822 to the RX pins where it can be checked by the MAC.

MII Loopback is enabled by setting bit[14] in the BMCR.

8.4.8.3 PCS Loopback

PCS Loopback occurs in the PCS layer of the PHY. No signal processing is performed when using PCS Loopback.

PCS Input Loopback is enabled by setting bit[0] in the BISCR.

PCS Output Loopback is enabled by setting bit[1] in the BISCR.

8.4.8.4 Digital Loopback

Digital Loopback includes the entire digital transmit and receive paths. Data is looped back prior to the analog circuitry.

Digital Loopback is enabled by setting bit[2] in the BISCR.

8.4.8.5 Analog Loopback

When operating in 10BASE-Te or 100BASE-TX mode, signals can be looped back after the analog front-end. Analog Loopback requires 100-Ω terminations across pins #1 and #2 as well as 100-Ω terminations across pins #3 and #6 at the RJ45.

Analog Loopback is enabled by setting bit[3] in the BISCR.

8.4.8.6 Far-End (Reverse) Loopback

Far-End (Reverse) loopback is a special test mode to allow PHY testing with a link partner. In this mode, data that is received from the Link Partner passes through the PHY's receiver, is looped back at the MAC interface and then transmitted back to the Link Partner. While in Reverse Loopback mode, all data signals that come from the MAC are ignored.

Reverse Loopback is enabled by setting bit[4] in the BISCRCR.

8.4.9 BIST Configurations

The DP83822 incorporates an internal PRBS Built-in Self-Test (BIST) circuit to accommodate in-circuit testing and diagnostics. The BIST circuit can be used to test the integrity of transmit and receive data paths. The BIST can be performed using both internal loopbacks (digital or analog) or external loopback using a cable fixture. The BIST simulates pseudo-random data transfer scenarios in format of real packets and Inter-Packet Gap (IPG) on the lines. The BIST allows full control of the packet lengths and the IPG.

The BIST Packet Length is controlled using bits[10:0] in the BIST Control and Status Register #2 (BICSR2, address 0x001C). The BIST IPG Length is controlled using bits[7:0] in the BIST Control and Status Register #1 (BICSR1, address 0x001B).

The BIST is implemented with independent transmit and receive paths, with the transmit clock generating a continuous stream of a pseudo-random sequence. The device generates a 15-bit pseudo-random sequence for BIST. Received data is compared to the generated pseudo-random data to determine pass/fail status. The number of error bytes that the PRBS checker received is stored in bits[15:8] of the BICSR1. PRBS lock status and sync can be read from the BIST Control Register (BISCRCR, address 0x0016).

The PRBS test can be put in a continuous mode by using bit[14] in the BISCRCR. In continuous mode, when the BIST error counter reaches the maximum value, the counter starts counting from zero again. To read the BIST error count, bit[15] in the BICSR1 must be set to '1'. This will lock the current value of the BIST errors for reading. Please note that setting bit[15] also clears the BIST Error Counter.

8.4.10 Cable Diagnostics

With the vast deployment of Ethernet devices, the need for a reliable, comprehensive and user-friendly cable diagnostic tool is more important than ever. The wide variety of cables, topologies and connectors deployed results in the need to non-intrusively identify and report cable faults. The TI cable-diagnostic unit provides extensive information about cable integrity. The DP83822 offers the following capabilities in its Cable Diagnostic tool kit:

- Time Domain Reflectometry (TDR)

8.4.10.1 TDR

The DP83822 uses Time Domain Reflectometry (TDR) to determine the quality of the cables, connectors and terminations in addition to estimating the cable length. Some of the possible problems that can be diagnosed include opens, shorts, cable impedance mismatch, bad connectors, termination mismatches, cross faults, cross shorts and any other discontinuities along the cable.

The DP83822 transmits a test pulse of known amplitude (1 V) down each of the two pairs of an attached cable. The transmitted signal continues down the cable and reflects from each cable imperfection, fault, connector and from the end of the cable itself. After the pulse transmission, the DP83822 measures the return time and amplitude of all these reflected pulses. This technique enables measuring the distance and magnitude (impedance) of non-terminated cables (open or short), discontinuities (bad connectors) and improperly terminated cables with $\pm 1\text{m}$ accuracy.

For all TDR measurements, the transformation between time of arrival and physical distance is done by the external host using minor computations (such as multiplication, addition and lookup tables). The host must know the expected propagation delay of the cable, which depends, among other things, on the cable category (for example, CAT5, CAT5e, or CAT6).

TDR measurement is allowed in the following scenarios:

- While the Link Partner is disconnected – cable is unplugged at the other side
- Link Partner is connected but remains “quiet” (for example, in power down mode)
- TDR could be automatically activated when the link fails or is dropped

TDR Auto-Run can be enabled by using bit[8] in the Control Register #1 (CR1, address 0x0009). When a link drops, TDR will automatically execute and store the results in the respective TDR Cable Diagnostic Location Result Registers #1 - #5 (CDLRR, addresses 0x0180 to 0x0184) and the Cable Diagnostic Amplitude Result Registers #1 - #5 (CDLAR, addresses 0x0185 to 0x0189). TDR can also be run manually using bit[15] in the Cable Diagnostic Control Register (CDCR, address 0x001E). Cable diagnostic status is obtained by reading bits[1:0] in the CDCR. Additional TDR functions including cycle averaging, bypass channel and crossover disable can be found in the Cable Diagnostic Specific Control Register (CDSCR, address 0x0170).

8.4.11 Fast Link Down Functionality

The DP83822 includes advanced link-down capabilities that support various real-time applications. The link-down mechanism is configurable and includes enhanced modes that allow extremely fast link-drop reaction times.

The DP83822 supports an enhanced link drop mechanism, also called Fast Link Drop (FLD), which shortens the observation window for determining link. There are multiple ways of determining link status, which can be enabled or disabled based on user preference. Fast Link Drop can be enabled in hardware with bootstrapping or in software using register configuration. RX_D2 when strapped to either mode 2 or mode 3 will enable FLD at power-up or hardware reset. Additionally, FLD can be configured using the Control Register #3 (CR3, address 0x000B). Bits[3:0] and bit[10] allow for various FLD conditions to be enabled. When link drop occurs, indication of a particular fault condition can be read from the Fast Link Down Status Register (FLDS, address 0x000F).

Figure 27. Fast Link Down

Fast Link Down criteria include:

- RX Error Count - when a predefined number of 32 RX_ERs occur in a 10 μ s window, the link will be dropped.
- MLT3 Error Count - when a predefined number of 20 MLT3 errors occur in a 10 μ s window, the link will be dropped.
- Low SNR Threshold - when a predefined number of 20 threshold crossings occur in a 10 μ s window, the link will be dropped.
- Signal/Energy Loss - when the energy detector indicates energy loss, the link will be dropped.

The Fast Link Down functionality allows the use of each of these options separately or in any combination.

NOTE

Because this mode enables extremely quick reaction time, it is more exposed to temporary bad link-quality scenarios.

8.5 Programming

8.5.1 Hardware Bootstrap Configurations

The DP83822 uses the receive path functional pins as bootstrap options to place the device into specific modes of operation. The values of these pins are sampled at power-up and/or hardware reset, through either the RESET pin or bit[15] in the PHY Reset Control Register (PHYRCR, address 0x001F).

The DP83822 bootstrap pins are 4-level, which are described in greater detail below.

NOTE

Because bootstrap pins may have alternate functions after reset is de-asserted, they should not be connected directly to VCC or GND. pullup and pulldown resistors are required for proper operation.

Pins: COL, LED_0, CRS and RX_ER have internal pullup resistors. All other pins with bootstraps have internal pulldown resistors. To account for the difference between the internal pullup and pulldown, please reference [Table 8](#) and [Table 9](#) below for proper implementation.

LED_0 and LED_1 require parallel pullup or pulldown resistors when using the pin in conjunction with an LED and current limiting resistor.

Configuration of the device may be done via 4-level strapping or via serial management interface. A pullup resistor and a pulldown resistor of suggested values should be used to set the voltage ratio of the bootstrap pin input and the supply to select one of the possible modes.

Figure 28. Bootstrap Circuits

8.5.2 LED Configuration

The DP83822 supports up to three configurable Light Emitting Diode (LED) pins: LED_0, LED_1 (GPIO1), COL (GPIO2) and RX_D3 (GPIO3). Several functions can be multiplexed onto the LEDs for different modes of operation. The LED configuration modes are selected using the LEDs Configuration Register (LEDCFG1, register 0x0460) and the Multi-LED Control Register (MLEDCCR, register 0x0025). LED_0 and COL (GPIO2) use the MLED function found in register 0x0025. MLED can be routed to only one of these two pins at a time. MLED routing is determined by bits[1:0] in register 0x0025.

Because LED pins are also used as bootstrap pins, external components must be considered in order to avoid contention. LED pins are automatically configured for the proper polarity based on the bootstrap configuration at power-up or hardware reset. If an LED pin is resistively pulled low, the corresponding output will be configured as an active high driver. Conversely, if a given bootstrap input is resistively pulled high, the corresponding output will be configured as an active low driver.

An example below shows proper bootstrap connections for LED pins using either pullup or pulldown configurations.

Note: A parallel resistor is required to ensure proper bootstrap configuration. A 1.96kΩ to 2.49kΩ resistor should be used as the parallel pull resistor.

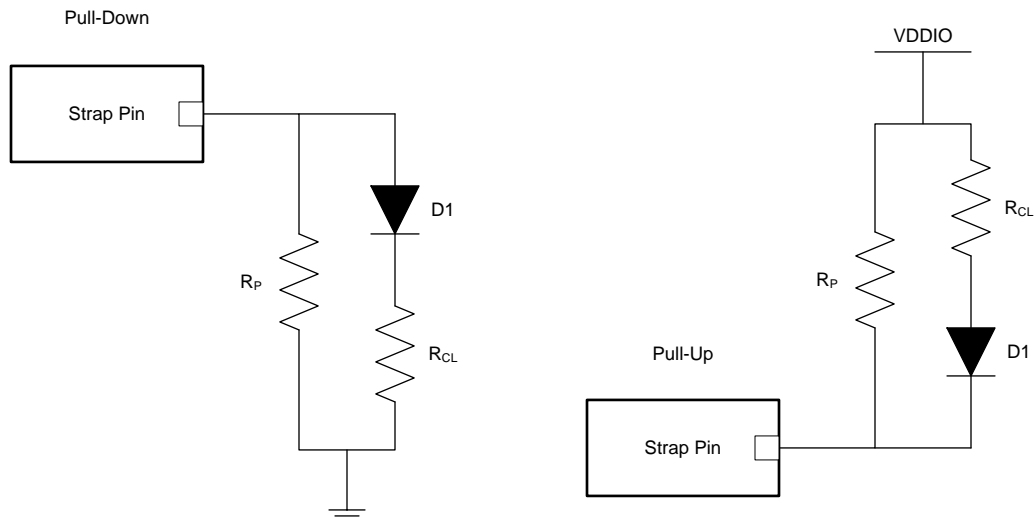

Figure 29. Example Strap Connections

8.5.3 PHY Address Configuration

The DP83822 can be configured for any of the 32 possible PHY addresses available through bootstrap configuration. The PHY address is latched into the device upon power-up or hardware reset. Each DP83822 or port sharing PHY on the serial management bus in the system must have a unique PHY address. The DP83822 supports PHY address strapping values 0x0000 (0b00000) through 0x001F (0b11111).

By default, the DP83822 will latch-in PHY address 0x0001 (0b00001). This address can be changed by adding the required pullup or pulldown resistors defined in the bootstrap section above.

8.6 Register Maps

In the register definitions under the “TYPE” heading, the following definitions apply:

COR	Clear on Read
Strap	Default value loads from bootstrap pin after reset
LH	Latched high and held until read
LL	Latched low and held until read
RO	Read Only Access
RO/COR	Read Only, Clear on Read
RO/P	Read Only, Permanently set to a default value
RW	Read Write access
RW/SC	Read Write access, Self Clearing bit
SC	Register sets on event occurrence and Self-Clears when event ends

Table 15. 0x0000 Basic Mode Control Register (BMCR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15	Reset	RW, SC	0	PHY Software Reset: 1 = Initiate software Reset / Reset in Progress 0 = Normal Operation Writing a 1 to this bit resets the PHY PCS registers. When the reset operation is done, this bit is cleared to 0 automatically. PHY Vendor Specific registers will not be cleared.
14	MII Loopback	RW	0	MII Loopback: 1 = MII Loopback enabled 0 = Normal Operation When MII loopback mode is activated, the transmitted data presented on MII TXD is looped back to MII RXD internally.
13	Speed Selection	RW, Strap	1	Speed Select: 1 = 100 Mbps 0 = 10 Mbps When Auto-Negotiation is disabled (bit[12] = 0 in Register 0x0000), writing to this bit allows the port speed to be selected.
12	Auto-Negotiation Enable	RW, Strap	1	Auto-Negotiation Enable: 1 = Enable Auto-Negotiation 0 = Disable Auto-Negotiation If Auto-Negotiation is disabled, bit[8] and bit[13] of this register determine the port speed and duplex mode.
11	IEEE Power Down	RW	0	Power Down: 1 = IEEE Power Down 0 = Normal Operation The PHY is powered down after this bit is set. Only register access is enabled during this power down condition. To control the power down mechanism, this bit is OR'ed with the input from the INT/PWDN_N pin. When the active low INT/PWDN_N is asserted, this bit is set.
10	Isolate	RW	0	Isolate: 1 = Isolates the port from the MII with the exception of the SMI 0 = Normal Operation
9	Restart Auto-Negotiation	RW, SC	0	Restart Auto-Negotiation: 1 = Restarts Auto-Negotiation 0 = Normal Operation If Auto-Negotiation is disabled (bit[12] = 0), bit[9] is ignored. This bit is self-clearing and will return a value of 1 until Auto-Negotiation is initiated, whereupon it will self-clear. Operation of the Auto-Negotiation process is not affected by the management entity clearing this bit.

Register Maps (continued)
Table 15. 0x0000 Basic Mode Control Register (BMCR) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION
8	Duplex Mode	RW, Strap	1	Duplex Mode: 1 = Full-Duplex 0 = Half-Duplex When Auto-Negotiation is disabled, writing to this bit allows the port Duplex capability to be selected.
7	Collision Test	RW	0	Collision Test: 1 = Enable COL Signal Test 0 = Normal Operation When set, this bit causes the COL signal to be asserted in response to the assertion of TX_EN within 512 bit times. The COL signal is de-asserted within 4 bit times in response to the de-assertion to TX_EN.
6:0	Reserved	RO	0	Reserved

Table 16. 0x0001 Basic Mode Status Register (BMSR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15	100Base-T4	RO	0	100Base-T4 Capable: This protocol is not available. Always reads as 0.
14	100Base-TX Full-Duplex	RO	1	100Base-TX Full-Duplex Capable: 1 = Device able to perform Full-Duplex 100Base-TX 0 = Device not able to perform Full-Duplex 100Base-TX
13	100Base-TX Half-Duplex	RO	1	100Base-TX Half-Duplex Capable: 1 = Device able to perform Half-Duplex 100Base-TX 0 = Device not able to perform Half-Duplex 100Base-TX
12	10Base-Te Full-Duplex	RO	1	10Base-Te Full-Duplex Capable: 1 = Device able to perform Full-Duplex 10Base-Te 0 = Device not able to perform Full-Duplex 10Base-Te
11	10Base-Te Half-Duplex	RO	1	10Base-Te Half-Duplex Capable: 1 = Device able to perform Half-Duplex 10Base-Te 0 = Device not able to perform Half-Duplex 10Base-Te
10:7	Reserved	RO	0	Reserved
6	SMI Preamble Suppression	RO	1	Preamble Suppression Capable: 1 = Device able to perform SMI transaction with preamble suppressed 0 = Device not able to perform SMI transaction with preamble suppressed If this bit is set to 1, 32-bits of preamble needed only once after reset, invalid opcode or invalid turnaround.
5	Auto-Negotiation Complete	RO	0	Auto-Negotiation Complete: 1 = Auto-Negotiation process completed 0 = Auto Negotiation process not completed (either still in process, disabled or reset)
4	Remote Fault	RO, LH	0	Remote Fault: 1 = Remote fault condition detected 0 = No remote fault condition detected Far End Fault indication or notification from Link Partner of Remote Fault. This bit is cleared on read or reset.
3	Auto-Negotiation Ability	RO	1	Auto-Negotiation Ability: 1 = Device is able to perform Auto-Negotiation 0 = Device is not able to perform Auto-Negotiation
2	Link Status	RO, LL	0	Link Status: 1 = Valid link established (for either 10 Mbps or 100 Mbps operation) 0 = Link not established
1	Jabber Detect	RO, LH	0	Jabber Detect: 1 = Jabber condition detected 0 = No jabber condition detected This bit only has meaning for 10Base-Te operation.

Otherwise, the code is interpreted as an Unformatted Page, and the interpretation is application specific. The default value of the CODE represents a Null Page as defined in Annex 28C of IEEE 802.3u.

Table 24. 0x0009 Control Register #1 (CR1)

BIT	NAME	TYPE	DEFAULT	FUNCTION																				
15:10	Reserved	RO	0	Reserved																				
9	RMI Enhanced Mode	RW	0	<p>RMI Enhanced Mode: 1 = Enable RMI Enhanced Mode 0 = RMI operated in normal mode</p> <p>In normal RMI mode, if the line is not idle, CRS_DV goes high. As soon as the False Carrier is detected, RX_ER is asserted and RXD is set to "2" (0010). This situation remains for the duration of the receive event. While in enhanced mode, CRS_DV is disqualified and de-asserted when the False Carrier is detected. This status also remains for the duration of the receive event. In addition, in normal mode, the start of the packet is intact. Each symbol error is indicated by setting RX_ER high. The data on RXD is replaced with "1" starting with the first symbol error. While in enhanced mode, the CRS_DV is de-asserted with the first symbol error.</p>																				
8	TDR Auto-Run	RW	0	<p>TDR Auto-Run at Link Down: 1 = Enable execution of TDR procedure after link down event 0 = Disable automatic execution of TDR</p>																				
7	Link Loss Recovery	RW	0	<p>Link Loss Recovery: 1 = Enable Link Loss Recovery mechanism 0 = Normal Link Loss operation</p> <p>This mode allows recovery from short interference and continue to hold the link up for a few additional mSec until the short interference is gone and the signal is OK. Under Normal Link Loss operation, Link status will go down approximately 250µs from signal loss.</p>																				
6	Fast Auto MDIX	RW	0	<p>Fast Auto-MDIX: 1 = Enable Fast Auto-MDIX 0 = Normal Auto-MDIX</p> <p>If both link partners are configured to work in Force 100Base-TX mode (Auto-Negotiation disabled), this mode enables Automatic MDI/MDIX resolution in a shortened time.</p>																				
5	Robust Auto MDIX	RW	0	<p>Robust Auto-MDIX: 1 = Enable Robust Auto-MDIX 0 = Disable Auto-MDIX</p> <p>If link partners are configured for operational modes that are not supported by normal Auto-MDIX, Robust Auto-MDIX allows MDI/MDIX resolution and prevents deadlock.</p> <p>When the DP83822 is strapped for 100 Mbps operation with Auto-MDIX capabilities, Robust Auto-MDIX will be automatically set to aid in MDI/MDIX resolution and deadlock prevention.</p>																				
4	Fast Auto-Negotiation Enable	RW	0	<p>Fast Auto-Negotiation Enable: 1 = Enable Fast Auto-Negotiation 0 = Disable Fast Auto-Negotiation</p> <p>The PHY Auto-Negotiations using timer setting according to Fast Auto-Negotiation Select bits (bits[3:2] in this register).</p>																				
3:2	Fast Auto-Negotiation Select	RW	0	<p>Fast Auto-Negotiation Select Bits: Adjusting these bits reduces the time it takes to Auto-Negotiate between two PHYs. In Fast Auto-Negotiation, both PHYs should be set to the same configuration. These 2 bits define the duration for each state of the Auto-Negotiation process according to the table above. The new duration time must be enabled by setting "Fast Auto Negotiation Enable" (bit [4] of this register). Note: Using this mode in cases where both link partners are not configured to the same Fast-Autonegotiation configuration might produce scenarios with unexpected behavior.</p>																				
				<table border="1"> <thead> <tr> <th>Fast Auto-Negotiation Select</th> <th>Break Link Timer</th> <th>Link Fail Inhibit Timer</th> <th>Auto-Negotiation Wait Timer</th> </tr> </thead> <tbody> <tr> <td><00></td> <td>80</td> <td>50</td> <td>35</td> </tr> <tr> <td><01></td> <td>120</td> <td>75</td> <td>50</td> </tr> <tr> <td><10></td> <td>240</td> <td>150</td> <td>100</td> </tr> <tr> <td><11></td> <td>NA</td> <td>NA</td> <td>NA</td> </tr> </tbody> </table>	Fast Auto-Negotiation Select	Break Link Timer	Link Fail Inhibit Timer	Auto-Negotiation Wait Timer	<00>	80	50	35	<01>	120	75	50	<10>	240	150	100	<11>	NA	NA	NA

Table 24. 0x0009 Control Register #1 (CR1) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION
1	Fast RX_DV Detection	RW	0	Fast RX_DV Detection: 1 = Enable Fast RX_DV detection 0 = Diabie Fast RX_DV detection When Fast RX_DV is enabled, RX_DV will assert high on receive packet due to detection of the /J/ symbol only. If a consecutive /K/ does not appear, RX_ER is generated. In normal mode, RX_DV will only be asserted after detection of /JK/.
0	Reserved	RO	0	Reserved

Table 25. 0x000A Control Register #2 (CR2)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15	100Base-TX Force Far-End Link drop	RW	0	100Base-TX Force Far-End Link Drop: Writing a 1 asserts the 100Base-TX Force Far-End link drop mode. In this mode (only valid for 100 Mbps), the PHY disables the TX upon link drop to allow the far-end peer to drop its link as well, thus allowing both link partners to be aware of the system link failure. This mode exceeds the standard definition of force 100 Mbps.
14	100Base-FX Enable	RW, Strap	0	100Base-FX Enable: 1 = 100Base-FX mode enabled 0 = 100Base-FX mode disabled
13:7	Reserved	RW	00 0001 0	Reserved
6	Fast Link-Up in Parallel Detect	RW	0	Fast Link-Up in Parallel Detect Mode: 1 = Enable Fast Link-Up time during Paralled Detection 0 = Normal Parallel Detection Link establishment In Fast Auto MDIX and in Robust Auto-MDIX modes (bit[6] and bit[5] in register CR1), this bit is automatically set.
5	Extended Full-Duplex Ability	RW	0	Extended Full-Duplex Ability: 1 = Enable Extended Full-Duplex Ability 0 = Diabie Extended Full-Duplex Ability In Extended Full-Duplex ability, when the PHY is set to Auto-Negotiation or Force 100Base-TX and the link partner is operated in Force 100Base-TX, the link is always Full-Duplex. When disabled, the decision to work in Full-Duplex or Half-Duplex mode follows IEEE specification.
4	Enhanced LED Link	RW	0	Enhanced LED Link: 1 = LED ON only when link is 100Base-TX Full-Duplex mode 0 = LED ON when link is established In Enhanced LED Link mode, TX/RX BLINK on activity is disabled for this LED pin. LED will only indicate LINK for established 100Base-TX Full-Duplex links.
3	Isolate MII in 100Base-TX Half-Duplex or 10Base-Te	RW	0	Isolate MII: 1 = Isolate MII Enabled 0 = Normal MII output operation In Isolate MII, MII outputs are isolated when Half-Duplex link established for 100Base-TX or when Half-Duplex or Full-Duplex link established for 10Base-Te.
2	RX_ER During IDLE	RW	1	Detection of Receive Symbol Error During IDLE State: 1 = Enable detection of Receive symbol error during IDLE state 0 = Disable detection of Receive symbol error during IDLE state
1	Odd-Nibble Detection Disable	RW	0	Detection of Transmit Error: 1 = Disable detection of transmit error in odd-nibble boundary 0 = Enable detection of transmit error in odd-nibble boundary Detection of odd-nibble will extend TX_EN by one additional TX_CLK cycle and behaves as if TX_ER were asserted during that additional cycle
0	RMII Receive Clock	RW	0	RMII Receive Clock: 1 = RMII Data (RXD[1:0]) is sampled and referenced to RX_CLK 0 = RMII Data (RXD[1:0]) is sampled and referenced to XI

Table 26. 0x000B Control Register #3 (CR3)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:11	Reserved	RW	0001 0	Reserved
10	Descrambler Fast Link Down Mode	RW	0	Descrambler Fast Link Drop: 1 = Drop the link on descrambler link loss 0 = Do not drop the link on descrambler link loss This option can be enabled in parallel to the other fast link down modes in bits[3:0].
9:7	Reserved	RW	0	Reserved
6	Polarity Swap	RW	0	Polarity Swap: 1 = Inverted polarity on both pairs: TD+ and TD-, RD+ and RD- 0 = Normal polarity Port Mirror Function: To enable port mirroring, set this bit and bit [5] high.
5	MDI/MDIX Swap	RW	0	MDI/MDIX Swap: 1 = Swap MDI pairs (Receive on TD pair, Transmit on RD pair) 0 = MDI pairs normal (Receive on RD pair, Transmit on TD pair) Port Mirror Function: To enable port mirroring, set this bit and bit[6] high.
4	Reserved	RW	0	Reserved
3:0	Fast Link Down Mode	RW	0000	Fast Link Down Modes: Bit 3 Drop the link based on RX Error count of the MII interface. When a predefined number of 32 RX Error occurrences in a 10µs interval is reached, the link will be dropped. Bit 2 Drop the link based on MLT3 Error count (Violation of the MLT3 coding in the DSP output). When a predefined number of 20 MLT3 Error occurrences in a 10µs interval is reached, the link will be dropped. Bit 1 Drop the link based on Low SNR Threshold . When a predefined number of 20 Threshold crossing occurrences in a 10µs interval is reached, the link will be dropped. Bit 0 Drop the link based on Signal/Energy Loss indication. When the Energy detector indicates Energy Loss, the link will be dropped. Typical reaction time is 10µs. The Fast Link Down function is an OR of all 5 options (bit[10] and bits[3:0]), the designer can enable any combination of these conditions.

Table 27. 0x000D Register Control Register (REGCR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:14	Extended Register Command	RW	0	Extended Register Command: 00 = Address 01 = Data, no post increment 10 = Data, post increment on read and write 11 = Data, post increment on write only
13:5	Reserved	RO	0	Reserved
4:0	DEVAD	RW	0	Device Address: Bits[4:0] are the device address, DEVAD, that directs any accesses of ADDAR register (0x000E) to the appropriate MMD. Specifically, the DP83822 uses the vendor specific DEVAD [4:0] = "11111" for accesses to registers 0x04D1 and lower. For MMD3 access, the DEVAD[4:0] = '00011'. For MMD7 access, the DEVAD[4:0] = '00111'. All accesses through registers REGCR and ADDAR should use the DEVAD for either MMD, MMD3 or MMD7. Transactions with other DEVAD are ignored.

Table 28. 0x000E Data Register (ADDAR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:0	Address/Data	RW	0	If REGCR register bits[15:14] = '00', holds the MMD DEVAD's address register, otherwise holds the MMD DEVAD's data.

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:14	RX_D1 Strap Mode	RO, Strap	00	RX_D1 Strap Mode: 00 = Mode 1 01 = Mode 2 10 = Mode 3 11 = Mode 4 Please refer to the strap section in the datasheet for information regarding PHY configuration. Note: Bit values ('00', '01', '10', '11') are just used to indicate the Strap Mode and do not reflect the same bit sequence that is defined in the strap section of the datasheet.
13:12	RX_D0 Strap Mode	RO, Strap	00	RX_D0 Strap Mode: Use same reference as defined by bits[15:14] in this register.
11:10	COL Strap Mode	RO, Strap	11	COL Strap Mode: Use same reference as defined by bits[15:14] in this register.

Table 76. 0x0467 Strap Latch-In Register #1 (SOR1) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION
9:8	RX_ER Strap Mode	RO, Strap	11	RX_ER Strap Mode: Use same reference as defined by bits[15:14] in this register.
7:6	CRS Strap Mode	RO, Strap	11	CRS Strap Mode: Use same reference as defined by bits[15:14] in this register.
5:4	RX_DV Strap Mode	RO, Strap	00	RX_DV Strap Mode: Use same reference as defined by bits[15:14] in this register.
3:2	Reserved	RO	00	Reserved
1:0	LED_0 Strap Mode	RO, Strap	11	LED_0 Strap Mode: 00 = Mode 1 01 = Reserved 10 = Reserved 11 = Mode 4 Please refer to the strap section in the datasheet for information regarding PHY configuration. Note: Bit values ('00', '01', '10', '11') are just used to indicate the Strap Mode and do not reflect the same bit sequence that is defined in the strap section of the datasheet.

Table 77. 0x0468 Strap Latch-In Register #2 (SOR2)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:4	Reserved	RO	0	Reserved
3:2	RX_D3 Strap Mode	RO, Strap	00	RX_D3 Strap Mode: Use same reference as defined by bits[15:14] in register 0x0467.
1:0	RX_D2 Strap Mode	RO, Strap	00	RX_D2 Strap Mode: Use same reference as defined by bits[15:14] in register 0x0467.

Table 78. 0x0469 LEDs Configuration Register #2 (LEDCFG2)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:11	Reserved	RO	0	Reserved
10	LED_1 Polarity	RW	0	LED_1 Polarity: 1 = Active High 0 = Active Low
9	LED_1 Force Override Value	RW	0	LED_1 Force Override Value: 1 = LED_1 forced High 0 = LED_1 forced Low
8	LED_1 Force Override Enable	RW	0	LED_1 Force Override Enable: 1 = Enable Force Override 0 = Disable Force Override When enabled, bit[9] in this register determines state of LED_1.
7	Reserved	RO	0	Reserved
6	LED_3 Polarity	RW	1	LED_3 Polarity: 1 = Active High 0 = Active Low
5	LED_3 Force Override Value	RW	0	LED_3 Force Override Value: 1 = RX_D3 forced High 0 = RX_D3 forced Low
4	LED_3 Force Override Enable	RW	0	LED_3 Force Override Enable: 1 = Enable Force Override 0 = Disable Force Override When enabled, bit[5] in this register determines state of RX_D3.
3:0	Reserved	RO	0	Reserved

Table 79. 0x04A0 Receive Configuration Register (RXFCFG)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:14	Bit Nibble Swap	RW	00	Bit Nibble Swap: 00 = Normal order, no swap (RXD[3:0]) 01 = Swap bits order (RXD[0:3]) 10 = Swap nibbles order (RXD[3:0] , RXD[7:4]) 11 = Swap bits order in each nibble (RXD[4:7] , RXD[0:3])
13	SFD Byte	RW	0	SFD Byte Search: 1 = SFD is 0x5D (i.e. Receive module searches for 0x5D) 0 = SFD is 0xD5 (i.e. Receive module searches for 0xD5)
12	CRC Gate	RW	1	CRC Gate: 1 = Bad CRC gates Magic Packet and Pattern Indications 0 = Bad CRC does not gate Magic Packet or Pattern Indications If Magic Packet has Bad CRC there will be no indication (status, interrupt, GPIO) when enabled.
11	WoL Level Change Indication Clear	W, SC	0	WoL Level Change Indication Clear: If WoL Indication is set for Level change mode, this bit clears the level upon a write.
10:9	WoL Pulse Indication Select	RW	00	WoL Pulse Indication Select: Only valid when WoL Indication is set for Pulse mode. 00 = 8 clock cycles (of 125-MHz clock) 01 = 16 clock cycles 10 = 32 clock cycles 11 = 64 clock cycles
8	WoL Indication Select	RW	0	WoL Indication Select: 1 = Level change mode 0 = Pulse mode
7	WoL Enable	RW	0	WoL Enable: 1 = Enable Wake-on-LAN (WoL) 0 = Normal operation
6	Bit Mask Flag	RW	0	Bit Mask Flag
5	Secure-ON Enable	RW	0	Enable Secure-ON password for Magic Packets
4:2	Reserved	RW	0	Reserved
1	WoL Pattern Enable	RW	0	Enable Interrupt upon reception of packet with configured pattern
0	WoL Magic Packet Enable	RW	0	Enable Interrupt upon reception of Magic Packet

Table 80. 0x04A1 Receive Status Register (RXFS)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:13	Reserved	RO	0	Reserved
12	WoL Interrupt Source	RW	0	WoL Interrupt Source: Source of Interrupt for bit[1] of register 0x0013. 1 = WoL Interrupt 0 = Data Polarity Interrupt When enabling WoL, this bit is automatically set to WoL Interrupt.
11:8	Reserved	RO	0	Reserved
7	SFD Error	RO, LH, SC	0	SFD Error: 1 = Packet with SFD error 0 = No SFD error
6	Bad CRC	RO, LH, SC	0	Bad CRC: 1 = Bad CRC was received 0 = No bad CRC received
5	Secure-On Hack Flag	RO, LH, SC	0	Secure-ON Hack Flag: 1 = Invalid Password detected in Magic Packet 0 = Valid Secure-ON Password
4:2	Reserved	RO, LH, SC	0	Reserved
1	WoL Pattern Status	RO, LH, SC	0	WoL Pattern Status: 1 = Valid packet with configured pattern received 0 = No valid packet with configured pattern received

Table 80. 0x04A1 Receive Status Register (RXFS) (continued)

9 Application and Implementation

NOTE

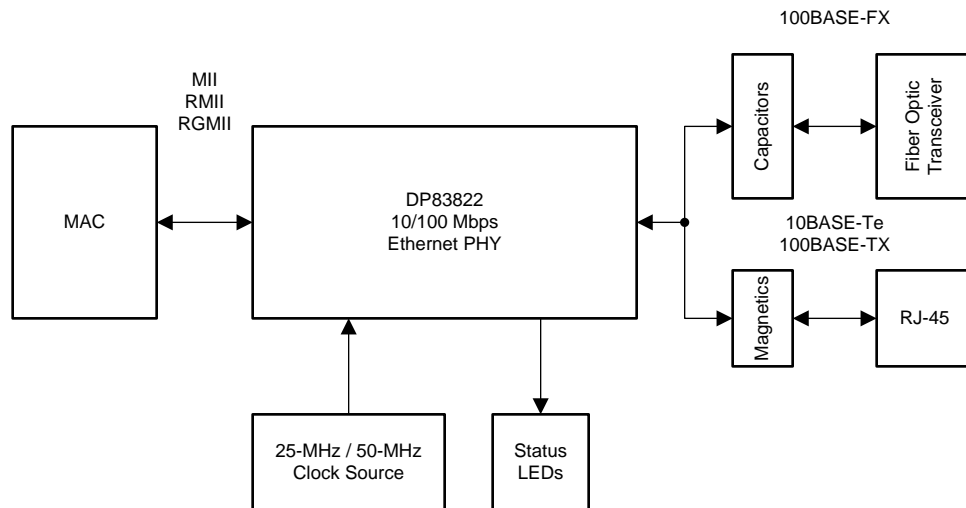

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DP83822 is a single-port 10/100 Mbps Ethernet PHY. It supports connections to an Ethernet MAC via MII, RMII or RGMII. Connections to the Ethernet media are made via the IEEE 802.3 defined Media Dependent Interface.

When using the device for Ethernet applications, it is necessary to meet certain requirements for normal operation. The following subsections are intended to assist in appropriate component selection and required circuit connections.

9.2 Typical Application

Typical Application (continued)

9.2.1 TPI Network Circuit

The recommended twisted-pair interface network circuit for 10/100 Mbps is below. Variations with PCB and component characteristics require that the application be tested to verify that the circuit meets the requirements of the intended application.

Center tap of the transformer must be connected to analog supply rail (AVD) with decoupling capacitors close to the transformer. All resistors and capacitors should be placed as close to the device as possible.

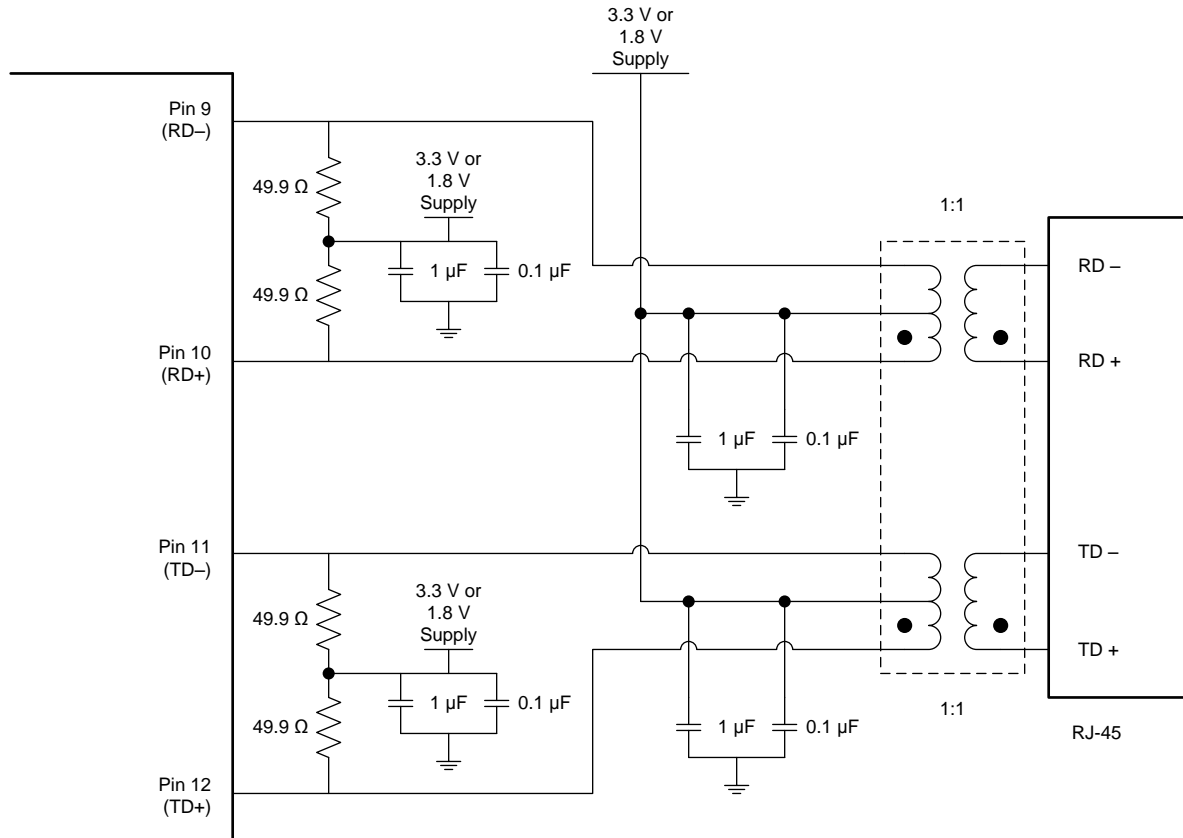

Figure 31. TPI Network Circuit

9.2.1.1 Design Requirements

The design requirements for the DP83822 in TPI operation (100BASE-TX or 10BASE-Te) are:

1. AVD Supply = 3.3 V or 1.8 V
2. Center Tap Supply = AVD Supply
3. VDDIO Supply = 3.3 V, 2.5 V or 1.8 V
4. Reference Clock Input = 25-MHz or 50-MHz (RMII Slave)

Typical Application (continued)

9.2.2 Fiber Network Circuit

The recommended circuit for a 100 Mbps fiber network is below. Variations with PCB and component characteristics require that the application be tested to verify that the circuit meets the requirements of the intended application.

All resistors and capacitors should be placed as close to the fiber transceiver as possible.

All values are typical and are ±1%

Place resistors and capacitors close to the fiber transceiver

Figure 32. Fiber Network Circuit

Typical Application (continued)

9.2.3 Clock Requirements

The DP83822 supports an external CMOS-level oscillator source or an internal oscillator with an external crystal.

9.2.3.1 Oscillator

If an external clock source is used, XI should be tied to the clock source and XO should be left floating. The amplitude of the oscillator should be a nominal voltage of VDDIO.

9.2.3.2 Crystal

The use of a 25-MHz, parallel, 20pF-load crystal is recommended if operating with a crystal. A typical connection diagram is shown below for a crystal resonator circuit. The load capacitor values will vary with the crystal vendors; check with the vendor for the recommended loads.

Figure 33. Crystal Oscillator Circuit

Typical Application (continued)

9.2.4 Detailed Design Procedure

The Media Independent Interface (MII / RMII / RGMII) connects the DP83822 to the Media Access Controller (MAC). The MAC may in-fact be a discrete device or integrated into a microprocessor, CPU, FPGA or ASIC. The Media Dependent Interface (MDI) connects the DP83822 to the transformer of the Ethernet network or to AC isolation capacitors when interfacing with a fiber transceiver.

9.2.4.1 MII Layout Guidelines

1. MII signals are single-ended signals
2. Traces should be routed with 50 Ω impedance to ground
3. Keep trace lengths as short as possible, less than two inches is recommended and less than six inches maximum

9.2.4.2 RMII Layout Guidelines

1. RMII signals are single-ended signals
2. Traces should be routed with 50 Ω impedance to ground
3. Keep trace lengths as short as possible, less than two inches is recommended and less than six inches maximum

9.2.4.3 RGMII Layout Guidelines

1. RGMII signals are single-ended signals
2. Traces should be routed with 50 Ω impedance to ground
3. Keep trace lengths as short as possible, less than two inches is recommended and less than six inches maximum
4. Internal Clock Delay can be enabled on the transmit and receive path independently within the DP83822 using register access

9.2.4.4 MDI Layout Guidelines

1. MDI signals are differential
2. Traces should be routed with 50 Ω impedance to ground or 100 Ω differential controlled impedance
3. Route MDI traces to the transformer on the same layer
4. Use a metal shielded RJ-45 connector and electrically connect the shield to chassis ground
5. Avoid supplies and ground beneath the magnetics
6. Do not overlap the circuit ground and chassis ground planes. Keep chassis ground and circuit ground isolated by turning chassis ground into an isolated island by leaving a gap between the planes. Connecting a 1206 (size) capacitor between chassis ground and circuit ground is recommended to avoid floating metal. Capacitors less than 805 (size) can create an arching path for ESD due to a small air-gap.

9.2.5 Application Curves

For expected TPI network MDI curves, please reference [Figure 15](#) and [Figure 16](#) and [Figure 18](#).

For expected Fiber network MDI curve, please reference [Figure 17](#).

10 Power Supply Recommendations

The DP83822 is capable of operating with a wide range of I/O supply voltages (3.3 V, 2.5 V or 1.8 V) along with any of the two analog supply options (3.3 V or 1.8 V).

The recommended power supply de-coupling network is shown below:

Figure 34. Power Connections

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Power Supply Characteristics

The following data was measured using a DP83822 evaluation module. All the power dissipation numbers are measured at nominal voltage under typical temperature of 25°C. Center tap must be connected to the same potential as the analog supply rail (AVD).

Table 135. Power Supply Characteristics⁽¹⁾

11 Layout

11.1 Layout Guidelines

11.1.1 Signal Traces

PCB traces are lossy and long traces can degrade signal quality. Traces should be kept short as possible. Unless mentioned otherwise, all signal traces should be 50Ω single-ended impedance. Differential traces should be 50Ω single-ended and 100Ω differential. Care should be taken to ensure impedance is controlled throughout. Impedance discontinuities will cause reflections leading to emissions and signal integrity issues. Stubs should be avoided on all signal traces, especially differential signal pairs.

Figure 35. Differential Signal Traces

Within the differential pairs, trace lengths should be run parallel to each other and matched in length. Matched lengths minimize delay differences, avoiding an increase in common mode noise and emissions. Length matching is also important for MAC interface connections. All transmit signal traces should be length matched to each other and all receive signal traces should be length matched to each other.

Ideally, there should be no crossover or vias on signal path traces. Vias present impedance discontinuities and should be minimized when possible. Route trace pairs on the same layer. Signals on different layers should not cross each other without at least one return path plane between them. Differential pairs should always have a constant coupling distance between them. For convenience and efficiency, TI recommends routing critical signals first (that is, MDI differential pairs, reference clock and MAC IF traces).

Layout Guidelines (continued)

11.1.2 Return Path

A general best practice is to have a solid return path beneath all signal traces. This return path can be a continuous ground or DC power plane. Reducing the width of the return path can potentially affect the impedance of the signal trace. This effect is more prominent when the width of the return path is comparable to the width of the signal trace. Breaks in return path between the signal traces should be avoided at all cost. A signal crossing a split plane may cause unpredictable return path currents and could impact signal quality and result in emissions issues.

Figure 36. Differential Signal Pair and Plane Crossing

Layout Guidelines (continued)

11.1.3 Transformer Layout

There should be no metal layer running beneath the transformer. Transformers can inject noise into metal beneath them, which can affect the performance of the system. Because the DP83822 is a current mode line driver design, the center tap pin on the device side of the transformer must be tied to the analog supply rail (AVD). De-coupling capacitors should be placed near the center tap pin of the transformer as shown in [Figure 31](#).

11.1.3.1 Transformer Recommendations

The following magnetics have been tested with the DP83822 using the DP83822EVM.

Table 136. Recommended Transformers

Manufacturer	Part Number
Pulse Electronics	HX1198FNL
	HX1188NL
	HX1188FNL
	H2019NL
	H1102NL
Abracon	ALAN101
Bel Fuse	S5585999J1F
Würth Electronics	7490120110
	733330
	7490100111a

Table 137. Transformer Electrical Specifications

Parameter	TYP	Units	Condition
Turn Ratio	1:1	-	±2%
Insertion Loss	-1	dB	1 - 100 MHz
Return Loss	-16	dB	1 - 30 MHz
	-12	dB	30 - 60 MHz
	-10	dB	60 - 80 MHz
Differential to Common Rejection Ratio	-30	dB	1 - 50 MHz
	-20	dB	50 - 150 MHz
Crosstalk	-35	dB	30 MHz
	-30	dB	60 MHz
Isolation	1500	Vrms	HPOT

11.1.4 Metal Pour

All metal pours that are not signals or power should be tied to ground. There should be no floating metal metal in the system. There should be no metal between differential traces.

11.1.5 PCB Layer Stacking

To meet signal integrity and performance requirements, minimum four-layer PCB is recommended. However, a six-layer PCB should be used when possible.

Figure 37. Recommended Layer Stack-Up

11.2 Layout Example

Please see the DP83822EVM for more information regarding layout.

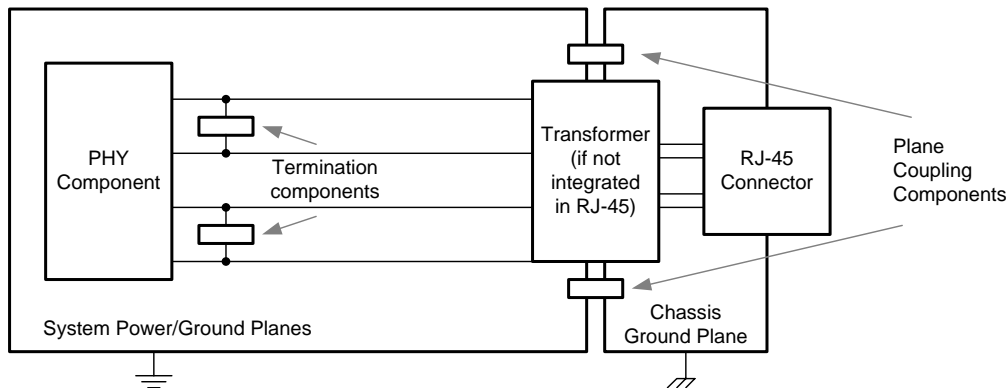

Figure 38. Layout Example

12.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. MECHANICAL DATA

RHB (S-PVQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

4204326/D 06/11

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - QFN (Quad Flatpack No-Lead) Package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Falls within JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: A. All linear dimensions are in millimeters

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
