

Davor Glisic

ABSTRACT

The DS160PR410EVM-RSC and DS160PR410EVM-SMA evaluation modules provide a complete high-bandwidth platform for evaluating the signal conditioning features of the Texas Instruments DS160PR410 Quad-Channel PCI-Express Gen-4 Linear Redriver. These evaluation boards can be used for standard compliance testing, performance evaluation, and initial system prototyping.

1 Introduction

The DS160PR410EVM-RSC evaluation module option features eight DS160PR410 linear redrivers that can extend the transmission distance of a PCIe Gen-4 x16 bus. It can directly be plugged into a PCIe slot on a Server / PC motherboard using one end of the board, and paired up with a PCIe Riser Card using the straddle mount connector attached to the other end of the board.

The DS160PR410EVM-SMA evaluation board option features a single, standalone DS160PR410 device with the high-speed I/Os routed to SMA connectors. The SMA connectors can interface to multiple connector types through commercially available breakout cables, adaptors, and boards (not included).

This document describes the DS160PR410EVM-SMA evaluation module.

1.1 Features

- One standalone 4-channel redriver with the high-speed I/Os routed to SMA connectors
- Linear equalization for seamless support of link training and PCIe channel extension
- CTLE boosts up to 18 dB at 8 GHz
- Programmable device configuration through GPIO or I2C / SMBus
- Industrial temperature range: –40°C to 85°C
- Flow-through layout in 4-mm × 6-mm 40-pin, leadless WQFN 0.4-mm pitch package

1.2 Applications

- PCI Express Gen-1, 2, 3, and 4
- High-speed interfaces up to 25 Gbps
- Enterprise server motherboard, workstation
- Enterprise storage
- Enterprise add-in card, end-point

1.3 Description

1.3.1 DS160PR410 4-Level I/O Control Inputs

The DS160PR410 has six (GAIN, VOD, EQ1_ADDR1, EQ0_ADDR0, EN_SMB, and RX_DET) 4-level input pins that are used to control the configuration of the device. These 4-level inputs use a resistor divider to help set the four valid levels and provide a wider range of control settings.

Table 1-1. 4-Level Control Pin Settings

PIN LEVEL	PIN SETTING
L0	1 k Ω to GND
L1	13 k Ω to GND
L2	Float
L3	59 k Ω to GND

1.3.2 DS160PR410 Modes of Operation

The DS160PR410 can be configured to operate in either Pin Mode, SMBus / I2C Slave Mode, or SMBus / I2C Master Mode. The mode of operation of the DS160PR410 is determined by the pin strap setting on the EN_SMB pin as shown in [Table 1-2](#).

Table 1-2. Modes of Operation

EN_SMB PIN LEVEL	MODE OF OPERATION
L0	Pin Mode
L1	SMBus / I2C Master Mode
L2	Reserved
L3	SMBus / I2C Slave Mode

1.3.3 DS160PR410 SMBus / I2C Register Control Interface

The DS160PR410 may be configured through a standard I2C or SMBus interface that may operate up to 1 MHz. The slave address of the DS160PR410 is determined by the pin strap settings on the EQ1_ADDR1 and EQ0_ADDR0 pins. The device can be configured for best signal integrity and power settings in the system using the I2C or SMBus interface. Certain status information is also available through this interface. The possible SMBus / I2C slave addresses are shown in [Table 1-3](#).

Table 1-3. SMBus / I2C Slave Address Settings

EQ1_ADDR1 PIN LEVEL	EQ0_ADDR0 PIN LEVEL	8-BIT WRITE ADDRESS (HEX)	7-BIT ADDRESS (HEX)
L0	L0	0x30	0x18
L0	L1	0x32	0x19
L0	L2	0x34	0x1A
L0	L3	0x36	0x1B
L1	L0	0x38	0x1C
L1	L1	0x3A	0x1D
L1	L2	0x3C	0x1E
L1	L3	0x3E	0x1F
L2	L0	0x40	0x20
L2	L1	0x42	0x21
L2	L2	0x44	0x22
L2	L3	0x46	0x23
L3	L0	0x48	0x24
L3	L1	0x4A	0x25
L3	L2	0x4C	0x26
L3	L3	0x4E	0x27

1.3.4 DS160PR410 Equalization Control

Each channel of the DS160PR410 features a continuous-time linear equalizer (CTLE) that applies high-frequency boost and low-frequency attenuation to help equalize the frequency-dependent insertion loss effects of the passive channel. [Table 1-4](#) shows available equalization gain that can be set through EQ0_ADDR0 and EQ1_ADDR1 control pins when operating in Pin Mode.

Table 1-4. Equalization Control Settings

EQ INDEX	EQ1_ADDR1 PIN LEVEL	EQ0_ADDR0 PIN LEVEL	CTLE BOOST AT 4 GHz (dB)	CTLE BOOST AT 8 GHz (dB)
0	L0	L0	-0.3	-0.8
1	L0	L1	0.4	1.3
2	L0	L2	3.3	5.7
3	L0	L3	3.8	7.1
4	L1	L0	4.9	8.4
5	L1	L1	5.2	9.1
6	L1	L2	5.4	9.8
7	L1	L3	6.5	10.7
8	L2	L0	6.7	11.3
9	L2	L1	7.7	12.6
10	L2	L2	8.7	13.6
11	L2	L3	9.1	14.4
12	L3	L0	9.4	15.0
13	L3	L1	10.3	15.9
14	L3	L2	10.6	16.5
15	L3	L3	11.8	17.8

The equalization gain of each channel can also be set by writing to SMBus / I2C registers in Slave or Master Modes. Refer to the [DS160PR410 Programming Guide](#) (SNLU255) for details.

1.3.5 DS160PR410 RX Detect State Machine

The DS160PR410 deploys an RX Detect state machine that governs the RX detection cycle as defined in the PCI Express specification. At power up or after a manually triggered event, the redriver determines whether or not a valid PCI Express termination is present at the far end of the link. The RX_DET pin of DS160PR410 provides additional flexibility to system designers to appropriately set the device in their desired mode, according to [Table 1-5](#).

Table 1-5. 4-Level Control Pin Settings

PWDN PIN LEVEL	RXDET PIN LEVEL	DESCRIPTION
L	L0	Reserved
L	L1	Reserved
L	L2	PCI Express RX detection state machine is enabled. Recommended for PCI Express use cases. Pre Detect: Hi-Z, Post Detect: 50 Ω.
L	L3	PCI Express RX detection state machine is disabled. Recommended for non-PCI Express use cases. Inputs are always 50 Ω.
H	X	Manual reset, inputs are Hi-Z

1.3.6 DS160PR410 Equalization DC Gain Control

When operating in Pin Mode, the VOD and GAIN pins can be used to set the overall datapath DC (low frequency) gain of the DS160PR410 as shown in [Table 1-6](#) and [Table 1-7](#).

Table 1-6. VOD Control

VOD PIN LEVEL	VOD SETTING
L0	-6 dB
L1	-3.5 dB
L2	0 dB (Recommended for most use cases)
L3	-1.6 dB

Table 1-7. GAIN Control

GAIN PIN LEVEL	GAIN SETTING
L0	Reserved
L1	Reserved
L2	0 dB (Recommended for most use cases)
L3	3.5 dB

The DC gain of each channel can also be set by writing to SMBus / I2C registers in Slave or Master Modes. Refer to the [DS160PR410 Programming Guide](#) (SNLU255) for details.

1.3.7 DS160PR410EVM-SMA Device Controls and Access Points

Table 1-8 shows DS160PR410EVM-SMA global controls.

Table 1-8. EVM Global Controls

COMPONENT	NAME	FUNCTION / DESCRIPTION
J1	3x2 Header	EN_SMB control tied to EN_SMB pin L0: Device set to Pin Mode (Default) L1: Device set to SMBus / I2C Master Mode L2: Reserved L3: Device set to SMBus / I2C Slave Mode Install a shunt to achieve L0, L1, or L3 level on the pin. Leave floating to achieve L2 level on the pin.
J2	5x2 Header	SMBus / I2C interface. The DS160PR410 device registers can be accessed through this interface.
J3	3x1 Header	PWDN control tied to PWDN1 and PWDN2 pins PWDN tied to GND: Device enabled (Default) PWDN tied to 3.3V_REG: Device disabled. PWDN floating: Not recommended
J4	3x1 Header	Access point to the WP (write protect) pin of the onboard EEPROM device WP tied to GND: I2C Access to the EEPROM enabled WP floating: I2C Access to the EEPROM disabled (default)
J11	2x1 Header	3.3-V supply input. Apply power to this connector to power the EVM.
J12	2x1 Header	Access point to the GND reference.
J21 - J28	SMA Connectors	Access points for all RX inputs
J32 - J39	SMA Connectors	Access points for all TX outputs
J29	12x2 Header	Additional Device Controls Use pins 1-6 for configuring EQ1_ADDR1 pin of SA1 device. Use pins 7-12 for configuring EQ0_ADDR0 pin of SA1 device. Use pins 13-18 for configuring VOD pin of SA1 device. Use pins 19-20 for configuring GAIN pin of SA1 device. Use pins 21-22 for configuring RXDET pin of SA1 device. Use pins 23-24 for accessing READ_EN_N pin of SA1 device. Install a shunt to achieve L0, L1, or L3 level on the pin. Leave floating to achieve L2 level on the pin.

1.4 Quick-Start Guide (Pin Mode)

1. Check that the shunts are at the following default positions as shown in [Figure 1-1](#).
 - The redriver is configured to operate in Pin Mode (EN_SMB pin tied to L0 using J1 header).
 - The redriver is enabled (PWDN pins tied to GND using J3 header).
 - DC Gain of the RX CTLE is set to 0 dB by leaving J29 (pins 19-20) open.
 - VOD is set to 0 dB by leaving J29 (pins 13-18) open.
 - RX_Detect state machine is enabled by leaving J29 (pins 21-22) open. Disable the state machine by installing a shunt across pins 21-22 of J29.
 - EQ level of the RX CTLEs of all channels is set to 13.6 dB at 8 GHz by leaving J29 (pins 1-12) open.
2. If necessary, adjust EQ levels by arranging shunts on J29 (pins 1-12).
3. Connect a pattern or data generator to one or all RX inputs (J21-J28).
4. Optionally, insert a lossy channel between a pattern generator and RX inputs to test EQ capability of the device.
5. Apply 3.3-V supply between J11 and J12.
6. Observe one or all TX outputs (J32-J39) using a BERT or a high-bandwidth oscilloscope.

1.5 Quick-Start Guide (SMBus Slave Mode)

1. Configure the devices to operate in the SMBus Slave Mode by setting its EN_SMB pin to the L3 level. This is accomplished by placing a shunt on J1 to L3 location.
2. Enable the devices by pulling its PWDN pins to GND. This is accomplished by placing a shunt on J3 between PWDN and GND.
3. Connect [USB2ANY](#) Adapter to J2 (Note that the USB2ANY Adapter is not supplied with the DS160PR410EVM-SMA).
4. Install [SigCon Architect](#) Version 3.0.0.10 application. It comes with the DS160PR410 profile.
5. Apply 3.3-V supply between J11 and J12.
6. Start the SigCon Architect application.
7. In the DS160PR410 Configuration Page, click on "Auto Detect" box to detect the EVM Model. If necessary, edit the devices addresses in the Edit Device Addresses box.
8. Select Low Level Page to initialize the register map tree in the application. Failure to perform this step may cause the application to crash.
9. In the DS160PR410 High Level Page, select Block Diagram as shown in [Figure 1-1](#).
10. Select desired EQ Settings and Driver VOD.
11. Click Apply to All Channels.
12. Connect a pattern or data generator to one or all RX inputs (J21 - J28).
13. Optionally, insert a lossy channel between a pattern generator and RX inputs to test EQ capability of the device.
14. Observe one or all TX outputs (J32 - J39) using a BERT or a high-bandwidth oscilloscope.

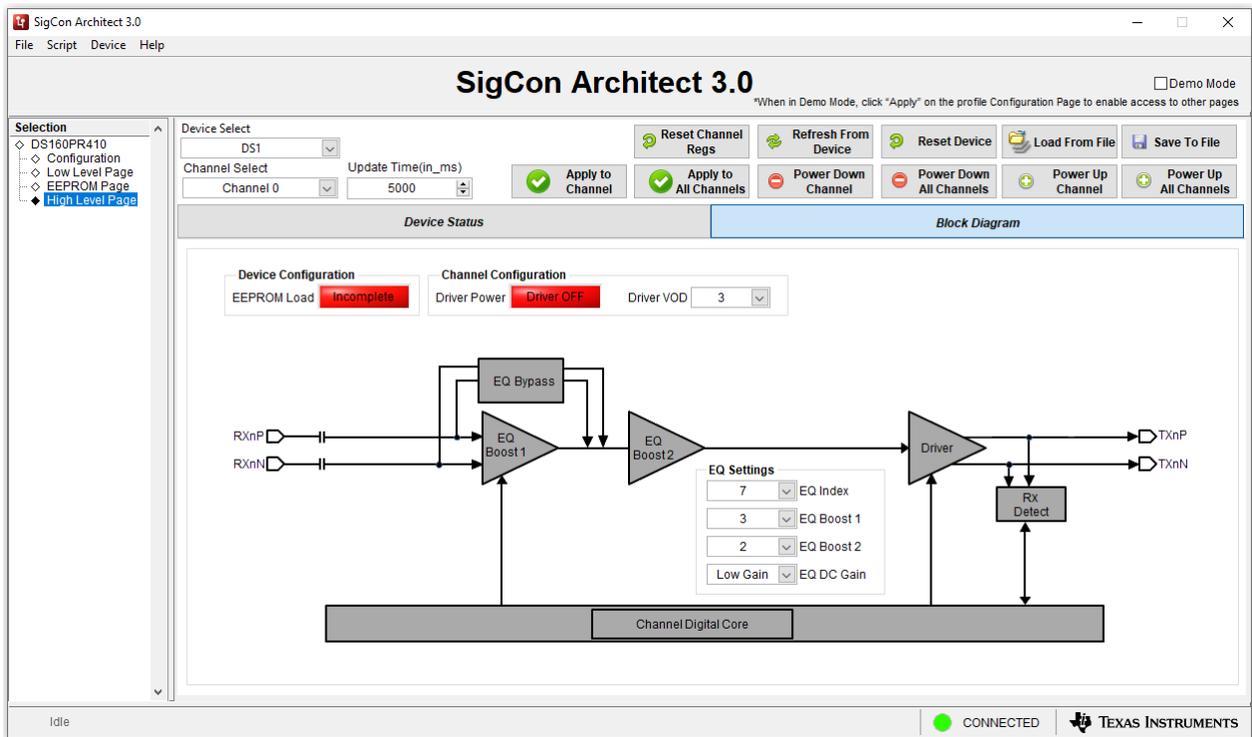

Figure 1-1. SigCon Architect DS160PR410 High Level Page

2 Test Setup and Results

Figure 2-1 shows an electric link that models a single channel of a PCIe link and displays eye diagrams measured at different locations along the link. The source that models a PCIe TX sends a 16-Gbps PRBS-15 signal with P7 presets. After a transmission channel with -30 dB at 8-GHz insertion loss, the eye diagram is fully closed. The DS160PR410 with its CTLE set to the maximum (18-dB boost) together with the source TX equalization compensates for the losses of the pre-channel (TL1) and opens the eye at the output of the DS160PR410. The DS160PR410 with its CTLE set to the maximum (18-dB boost) together with the source TX equalization compensates for the losses of the pre-channel (TL1) and opens the eye at the output of the DS160PR410.

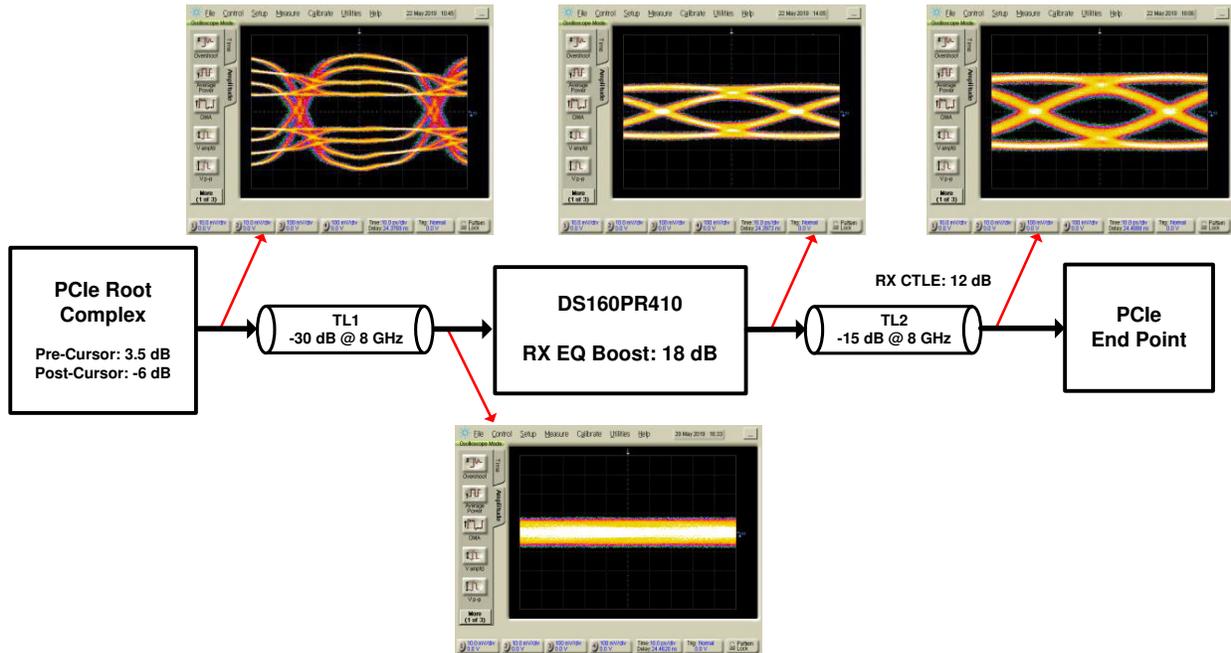

Figure 2-1. Example Test Setup and Results

The post-channel (TL2) losses mandate the use of PCIe RX equalization functions such as CTLE and DFE that are normally available in PCIe compliant receivers.
