2 OUTPUT PCIE GEN1/2 SYNTHESIZER

IDT5V41065

Recommended Applications

2 Output synthesizer for PCIe Gen1/2 and Ethernet

General Description

The IDT5V41065 is a PCIe Gen2 compliant spread spectrum capable clock generator. The device has 2 differential HCSL outputs and can be used in communication or embedded systems to subtantially reduce electro-magnetic interference (EMI). The spread amount and output frequency are selectable via select pins. The IDT5V41065 can also supply 25 MHz, 125 MHz and 200 MHz outputs for applications such as Ethernet.

Output Features

- 2 - 0.7V current mode differential HCSL output pairs

Features/Benefits

- 16-pin TSSOP package; small board footprint
- Spread-spectrum capable; reduces EMI
- Outputs can be terminated to LVDS; can drive a wider variety of devices
- 25 MHz, 125 MHz and 200 MHz output frequencies; supports Ethernet applications
- OE control pin; greater system power management
- Spread% and frequency pin selection; no software required to configure device
- Industrial temperature range available; supports demanding embedded applications
- **For PCIe Gen3 applications, see the 5V41235**

Key Specifications

- Cycle-to-cycle jitter < 100 ps
- Output-to-output skew < 50 ps
- PCIe Gen2 phase jitter < 3.0ps RMS

Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	S0	Input	Select pin 0. See Table1. Internal pull-up resistor.
2	S1	Input	Select pin 1. See Table 1. Internal pull-up resistor.
3	SS0	Input	Spread Select pin 0. See Table 2. Internal pull-up resistor.
4	X1/ICLK	Input	Crystal or clock input. Connect to a 25 MHz crystal or single ended clock.
5	X2	Output	Crystal connection. Leave unconnected for clock input.
6	OE	Input	Output enable. Tri-states outputs and device is not shut down. Internal pull-up resistor.
7	GNDXD	Power	Connect to ground.
8	SS1	Input	Spread Select pin 1. See Table 2. Internal pull-up resistor.
9	IREF	Output	Precision resistor attached to this pin is connected to the internal current reference.
10	CLK1	Output	HCSL complementary clock output 1.
11	CLK1	Output	HCSL true clock output 1.
12	VDDODA	Power	Connect to voltage supply +3.3 V for output driver and analog circuits
13	GNDODA	Power	Connect to ground.
14	CLK0	Output	HCSL complementary clock output 0.
15	CLK0	Output	HCSL true clock output 0.
16	VDDXD	Power	Connect to voltage supply +3.3 V for crystal oscillator and digital circuit.

Applications Information

External Components

A minimum number of external components are required for proper operation.

Decoupling Capacitors

Decoupling capacitors of 0.01 µF should be connected between each VDD pin and the ground plane, as close to the VDD pin as possible. Do not share ground vias between components. Route power from power source through the capacitor pad and then into ICS pin.

Crystal

A 25 MHz fundamental mode parallel resonant crystal should be used. This crystal must have less than 300 ppm of error across temperature in order for the IDT5V41065 to meet PCI Express specifications.

Crystal Capacitors

Crystal capacitors are connected from pins X1 to ground and X2 to ground to optimize the accuracy of the output frequency.

C_L= Crystal's load capacitance in pF

Crystal Capacitors (pF) = (C_L- 8) * 2

For example, for a crystal with a 16 pF load cap, each external crystal cap would be 16 pF. (16-8)*2=16.

Current Source (Iref) Reference Resistor - R_R

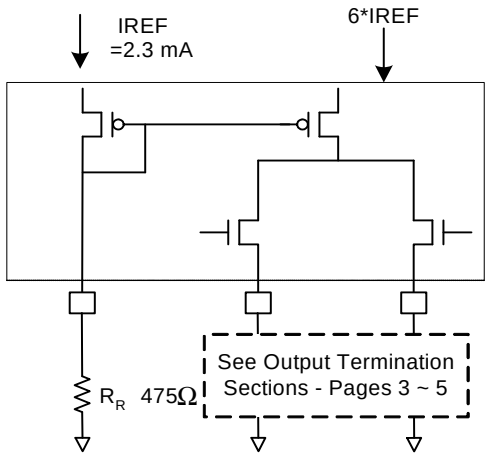
If board target trace impedance (Z) is 50Ω, then R_R = 475Ω (1%), providing IREF of 2.32 mA. The output current (I_{OH}) is equal to 6*IREF.

Output Termination

The PCI-Express differential clock outputs of the IDT5V41065 are open source drivers and require an external series resistor and a resistor to ground. These resistor values and their allowable locations are shown in detail in the **PCI-Express Layout Guidelines** section.

The IDT5V41065 can also be configured for LVDS compatible voltage levels. See the **LVDS Compatible Layout Guidelines** section.

Output Structures



General PCB Layout Recommendations

For optimum device performance and lowest output phase noise, the following guidelines should be observed.

1. Each 0.01µF decoupling capacitor should be mounted on the component side of the board as close to the VDD pin as possible.

2. No vias should be used between decoupling capacitor and VDD pin.

3. The PCB trace to VDD pin should be kept as short as possible, as should the PCB trace to the ground via. Distance of the ferrite bead and bulk decoupling from the device is less critical.

4. An optimum layout is one with all components on the same side of the board, minimizing vias through other signal layers (any ferrite beads and bulk decoupling capacitors can be mounted on the back). Other signal traces should be routed away from the IDT5V41065.This includes signal traces just underneath the device, or on layers adjacent to the ground plane layer used by the device.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the IDT5V41065. These ratings are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Revision History

Rev.	Originator	Date	Description of Change
A		07/15/08	New datasheet; Preliminary initial release.
B	RDW	01/13/10	Added Gen2 to title; update Electrical tables per char; added Differential Phase Jitter table.
C	RDW	04/27/10	Updated electrical tables per char; VDD is now 3.3 ±5%; released to final.
D	RDW	07/19/10	1. Updated title and general decription 2. Updated cycle-to-cycle jitter spec from 125 to 100 ps.
E	RDW	11/21/11	1. Changed title to “2 Output PCIe GEN1/2 Synthesizer” 2. Added note to Features section: “For PCIe Gen3 applications, see 5V41235” 3. Updated Differential Phase Jitter table.
