

Next Generation OP07, Ultralow Offset Voltage Operational Amplifier

OP77

FEATURES

- Outstanding Gain Linearity
- Ultra High Gain 5000V/mV Min
- Low V_{os} Over Temperature 60 μ V Max
- Excellent TCV_{os} 0.3 μ V/ $^{\circ}$ C Max
- High PSRR 3 μ V/V Max
- Low Power Consumption 60mW Max
- Fits OP-07, 725, 108A/308A, 741 Sockets
- Available in Die Form

* For devices processed in total compliance to MIL-SDT-883, add /883 after part number. Consult factory for 883 data sheet.

[†] Burn-in is available on commercial and industrial temperature range parts in CerDIP, plastic DIP, and TO-can packages.

^{††} For availability and burn-in information on SO and PLCC packages, contact your local sales office.

GENERAL DESCRIPTION

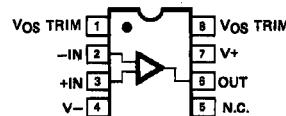

The OP-77 significantly advances the state-of-the-art in precision op amps. The OP-77's outstanding gain of 10,000,000 or more is maintained over the full ± 10 V output range. This exceptional gain-linearity eliminates incorrectable system nonlinearities common in previous monolithic op amps, and provides

superior performance in high closed-loop-gain applications. Low initial V_{os} drift and rapid stabilization time, combined with only 50mW power consumption, are significant improvements over previous designs. These characteristics, plus the exceptional TCV_{os} of 0.3 μ V/ $^{\circ}$ C maximum and the low V_{os} of 25 μ V maximum, eliminates the need for V_{os} adjustment and increases system accuracy over temperature.

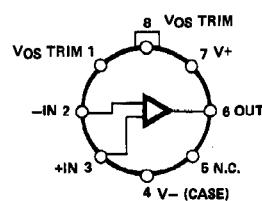

PSRR of 3 μ V/V (110dB) and CMRR of 1.0 μ V/V maximum virtually eliminate errors caused by power supply drifts and common-mode signals. This combination of outstanding characteristics makes the OP-77 ideally suited for high-resolution instrumentation and other tight error budget systems.

SIMPLIFIED SCHEMATIC

OP77

This product is available in six standard grades and five standard packages: the TO-99 can, the 8-pin mini-DIP in ceramic, SO or epoxy, and the 20-contact LCC.

The OP-77 is a direct or upgrade replacement for the OP-07, 05, 725, or 108A op amps. 741-types can be replaced by eliminating the V_{OS} adjust pot. For higher precision performance refer to OP-177.

ABSOLUTE MAXIMUM RATINGS (Note 2)

Supply Voltage	$\pm 22V$
Differential Input Voltage	$\pm 30V$
Input Voltage (Note 1)	$\pm 22V$
Output Short-Circuit Duration	Indefinite
Storage Temperature Range	
J, Z, and RC Packages	-65°C to +150°C
P Package	-65°C to +125°C
Operating Temperature Range	
OP-77A, OP-77B (J, Z, RC)	-55°C to +125°C
OP-77E, OPP-77F (J, Z)	-25°C to +85°C

OP-77E, OP-77F, OP-77G (P, S)	0°C to 70°
OP-77H (P, S)	-40°C to +85°C
Junction Temperature (T_j)	-65°C to +150°C
Lead Temperature (Soldering, 60 sec.)	+300°C

PACKAGE TYPE	Θ_{JA} (Note 3)	Θ_{JC}	UNITS
TO-99 (J)	150	18	°C/W
8-Pin Hermetic DIP (Z)	148	16	°C/W
8-Pin Plastic DIP (P)	103	43	°C/W
20-Contact LCC (RC, TC)	98	38	°C/W
8-Pin SO (S)	158	43	°C/W

NOTES:

- For supply voltages less than $\pm 22V$, the absolute maximum input voltage is equal to the supply voltage.
- Absolute maximum ratings apply to both DICE and packaged parts, unless otherwise noted.
- Θ_{JA} is specified for worst case mounting conditions, i.e., Θ_{JA} is specified for device in socket for TO, CerDIP, P-DIP, and LCC packages; Θ_{JA} is specified for device soldered to printed circuit board for SO package.

ELECTRICAL CHARACTERISTICS at $V_S = \pm 15V$, $T_A = +25^\circ C$, unless otherwise noted.

2. Guaranteed by end-point limits.

OPEN-LOOP GAIN LINEARITY

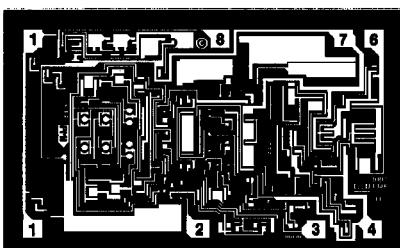

Actual open-loop voltage gain can vary greatly at various output voltages. All automated testers use end-point testing and therefore only show the average gain. This causes errors in high closed-loop gain circuits. Since this is so difficult for manufacturers to test, you should make your own evaluation. This simple test circuit makes it easy. An ideal op amp would show a horizontal scope trace.

This is the output gain linearity trace for the new OP-77. The output trace is virtually horizontal at all points, assuring extremely high gain accuracy. The average open-loop gain is truly impressive – approximately 10,000,000.

Power Consumption	P_d	$V_{OUT} = 0V$	60	60	mW MAX

NOTES:

1. Guaranteed by design.

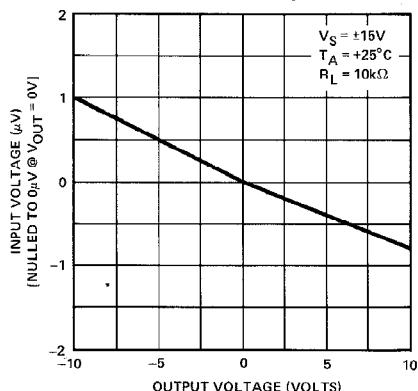

Electrical tests are performed at wafer probe to the limits shown. Due to variations in assembly methods and normal yield loss, yield after packaging is not guaranteed for standard product dice. Consult factory to negotiate specifications based on dice lot qualification through sample lot assembly and testing.

OP77

TYPICAL PERFORMANCE CHARACTERISTICS

APPLICATIONS INFORMATION

PRECISION HIGH-GAIN DIFFERENTIAL AMPLIFIER

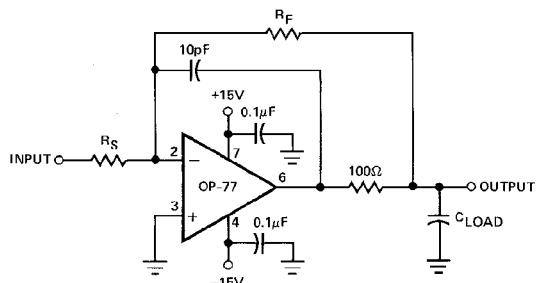

The high gain, gain linearity, CMRR, and low TCV_{OS} of the OP-77 make it possible to obtain performance not previously available in single stage very high-gain amplifier applications.

For best CMR, $\frac{R_1}{R_2}$ must equal $\frac{R_3}{R_4}$. In this example,

with a 10mV differential signal, the maximum errors are as listed.

TYPE	AMOUNT
COMMON-MODE VOLTAGE	0.01%/V
GAIN LINEARITY, WORST CASE	0.02%
TCV_{OS}	0.003%/°C
TCI_{OS}	0.008%/°C

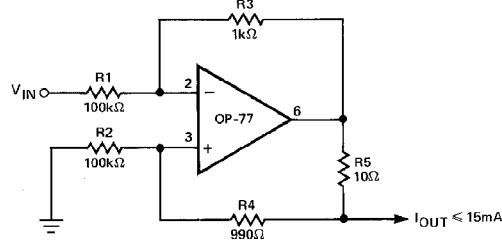

ISOLATING LARGE CAPACITIVE LOADS

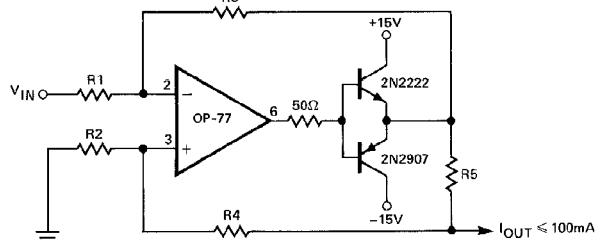

This circuit reduces maximum slew-rate but allows driving capacitive loads of any size without instability. Because the 100Ω resistor is inside the feedback loop, its effect on output impedance is reduced to insignificance by the high open-loop gain of the OP-77.

BILATERAL CURRENT SOURCE

BASIC CURRENT SOURCE

100mA CURRENT SOURCE

$$I_{OUT} = V_{IN} \frac{R_3}{R_1 + R_5}$$

GIVEN $R_3 = R_4 + R_5$, $R_1 = R_2$

These current sources will supply both positive and negative current into a grounded load.

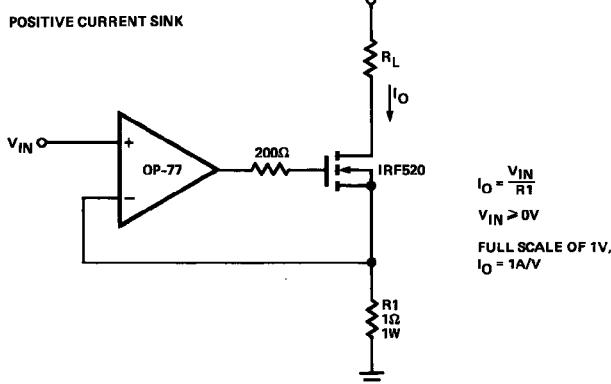

$$\text{Note that } Z_O = \frac{R_5 \left(\frac{R_4}{R_2} + 1 \right)}{\frac{R_5 + R_4}{R_2} - \frac{R_3}{R_1}}$$

and that for Z_O to be infinite,

$$\frac{R_5 + R_4}{R_2} \text{ must } = \frac{R_3}{R_1}.$$

OP77

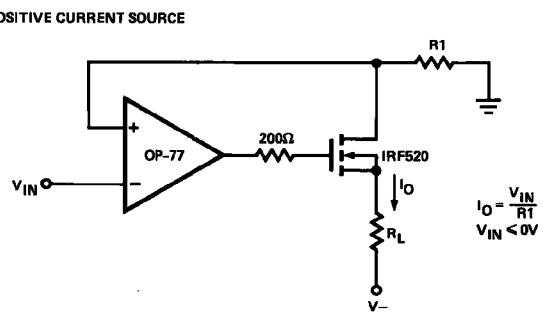

PRECISION CURRENT SINKS

$$I_O = \frac{V_{IN}}{R_1}$$

$$V_{IN} > 0V$$

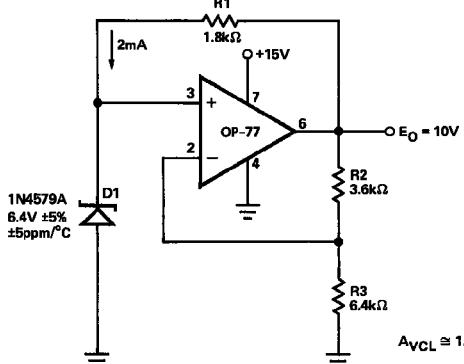

$$\text{FULL SCALE OF } 1V, I_O = 1A/V$$

These simple high current sinks require that the load float between the power supply and the sink.

In these circuits, OP-77's high gain, high CMRR, and low TCV_{OS} assure high accuracy.

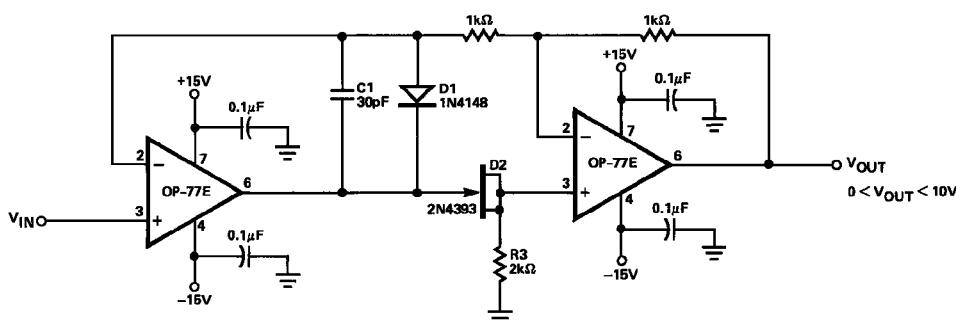

HIGH STABILITY VOLTAGE REFERENCE

This simple bootstrapped voltage reference provides a precise 10 volts virtually independent of changes in power supply voltage, ambient temperature, and output loading. Correct zener operating current of exactly $2mA$ is maintained by R_1 , a selected $5\text{ppm}/^\circ\text{C}$ resistor, connected to the regulated output. Accuracy is primarily determined by three factors: the $5\text{ppm}/^\circ\text{C}$ temperature coefficient of D_1 , $1\text{ppm}/^\circ\text{C}$ ratio tracking of R_2 and R_3 , and operational amplifier V_{OS} errors.

V_{OS} errors, amplified by 1.6 (A_{VCL}), appear at the output and can be significant with most monolithic amplifiers. For example: an ordinary amplifier with $\text{TC}V_{OS}$ of $5\mu\text{V}/^\circ\text{C}$ contributes $0.8\text{ppm}/^\circ\text{C}$ of output error while the OP-77, with $\text{TC}V_{OS}$ of $0.3\mu\text{V}/^\circ\text{C}$, contributes but $0.05\text{ppm}/^\circ\text{C}$ of output error, thus effectively eliminating $\text{TC}V_{OS}$ as an error consideration.

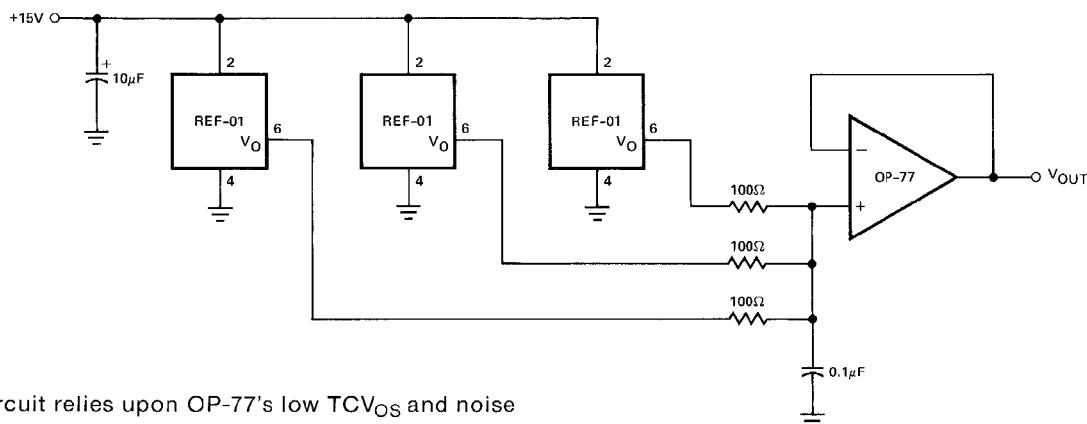

PRECISION ABSOLUTE VALUE AMPLIFIER

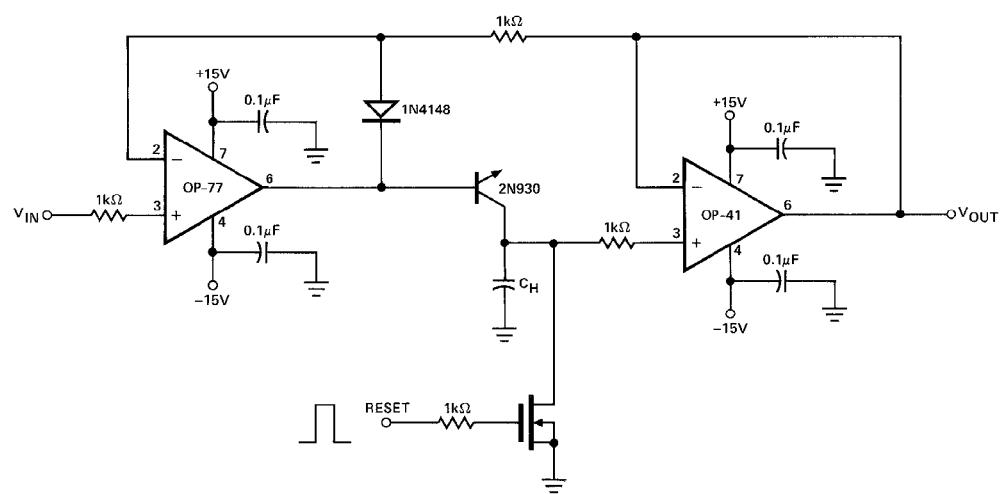

The high gain and low $\text{TC}V_{OS}$ assure accurate operation with inputs from microvolts to volts. In this circuit, the signal always appears as a common-mode signal to

the op amps. The OP-77E CMRR of $1\mu\text{V}/\text{V}$ assures errors of less than 2ppm .

LOW NOISE PRECISION REFERENCE

PRECISION POSITIVE PEAK DETECTOR

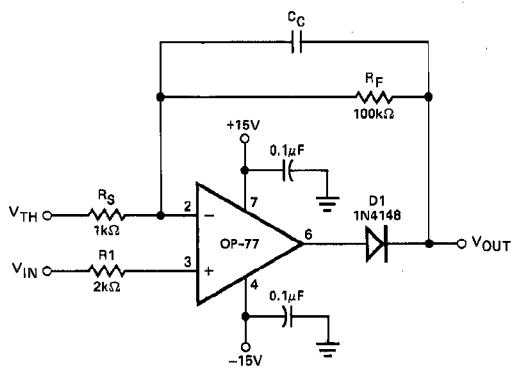

C_H must be of polystyrene, Teflon*, or polyethylene to minimize dielectric absorption and leakage. The droop

rate is determined by the size of C_H and the bias current of the OP-41.

*Teflon is a registered trademark of the Dupont Company.

OP77

PRECISION THRESHOLD DETECTOR/ AMPLIFIER

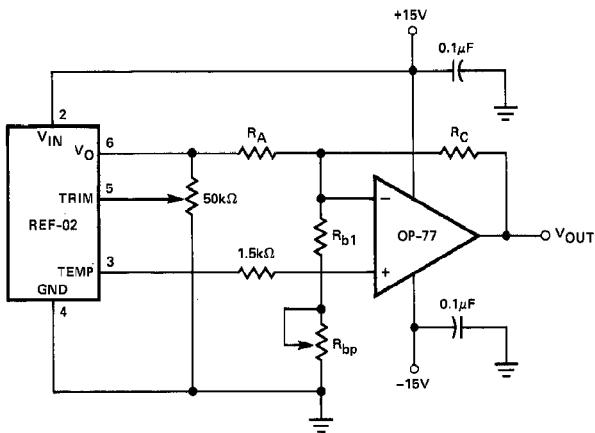

When $V_{IN} < V_{TH}$, amplifier output swings negative, reverse biasing diode D1. $V_{OUT} = V_{TH}$ if $R_L = \infty$. When $V_{IN} \geq V_{TH}$, the loop closes,

$$V_{OUT} = V_{TH} + (V_{IN} - V_{TH}) \left(1 + \frac{R_F}{R_S} \right).$$

C_C is selected to smooth the response of the loop.

PRECISION TEMPERATURE SENSOR

TCV _{OUT} SLOPE (\$)	10mV/°C	100mV/°C	10mV/°F
TEMPERATURE RANGE	-55°C to +125°C	-55°C to +125°C	-67°F to +257°F
OUTPUT VOLTAGE RANGE	-0.55V to +1.25V	-5.5V to +12.5V	-0.67V to +2.57V
ZERO-SCALE	0V @ 0°C	0V @ 0°C	0V @ 0°F
R _a ($\pm 1\%$ Resistor)	9.09kΩ	15kΩ	7.5kΩ
R _{b1} ($\pm 1\%$ Resistor)	1.5kΩ	1.82kΩ	1.21kΩ
R _{bp} (Potentiometer)	200Ω	500Ω	200Ω
R _c ($\pm 1\%$ Resistor)	5.11kΩ	84.5kΩ	6.25kΩ
