

NLHV011

1-Bit Gate Pulse Modulator

The NLHV011 is a 1-bit gate pulse modulator designed to translate logic voltages for TFT LCD panels. This part translates a low voltage logic input signal to an output voltage of 15 V to 38 V. In addition, the NLHV011 provides a user selectable delay and fall time on the high-to-low edge of the output signal. The delay and fall times are controlled by the magnitudes of the external capacitor resistor, respectively.

PIN DESCRIPTION

Pin	Pin Name	Pin Function	Comment
1	V_{GH}	Power Supply Input	$V_{GH} = 15$ to 38 V
2	V_{GH_M}	Output	This output directly drives the power supply of Gate Driver IC
3	R_E	R_E pin used to set the falling edge time (t_{fall})	The Delay time is programmed by connecting resistor R_E to V_{GH} and capacitor C_E to ground.
4	C_E	C_E pin used to set the propagation delay time (t_{ph})	
5	V_{DD}	Reference to input	The reference input pin is used to reduce flicker. The reference input voltage is as follows: $V_{DD} \leq V_{GH} - 8.5$ V, $V_{DD} = 0$ to 25 V
6	V_{DPM}	Signal input 1	V_{DPM} single input voltage is as follows: $V_{DPM} = 0$ V to V_{GH} . The V_{DPM} pin is used to create a delay with the V_{GH} to prevent system latch-up. V_{DPM} also determines the time V_{GH} is ON.
7	GND	Ground	
8	V_{FLK}	Signal input 2	V_{FLK} single input voltage is as follows: $V_{DPM} = 0$ V to V_{GH} . The V_{FLK} determines the ON/OFF time of the TFT LCD and is produced from LCD timing controller module.
